SOFT STEROIDS HAVING ANTI-INFLAMMATORY ACTIVITY

Technical Field of the Invention:

The invention relates to novel soft steroids having anti-inflammatory activity, pharmaceutical compositions containing said soft steroids, novel
5 chemical intermediates useful in the preparation of the steroids, and methods of administering said steroids to mammals in the treatment of inflammation.

Background Art:

Successful predictions on a rational basis of
10 the biological activity of compounds leading to new drugs are the main objective of drug designers. This has usually been achieved by considering a known bioactive molecule as the basis for structural modifications, either by the group or biofunctional
15 moieties approach or by altering the overall physical-chemical properties of the molecule. Thus, the main aim has been to design, synthesize, and test new compounds structurally analogous to the basic bioactive molecule which have, however, improved
20 therapeutic and/or pharmacokinetic properties. Although "vulnerable" moieties have been identified as the ones whose role is the bioinactivation or metabolic elimination of the drug after it has performed its role, little or no attention has been
25 paid in the drug-design process to the rational design of the metabolic disposition of the drugs. This has been the case despite the fact that the toxicity of a number of bioactive molecules is due to their increased elimination half-life, stability, or other
30 factors introduced during the design of increasing their activity. Drugs and particularly their metabolic processes contribute to the various toxic

SUBSTITUTE SHEET

-2-

processes by formation of active metabolites. The phenomenon of metabolic activation to macromolecules is the initial step in cell damage. It is also clear that the most toxic metabolites will not survive long enough to be excreted and identified; thus, studies of the stable metabolites may provide misleading information.

It is clear that, in order to prevent and/or reduce toxicity problems related to drugs, the metabolic disposition of the drugs should be considered at an early stage of the drug-design process. This is true particularly when one considers that the body can attack and alter chemically quite stable structures and that, even if a drug is 95% excreted unchanged, the unaccounted small portion can, and most likely will, cause toxicity.

"Soft drugs" can be defined as biologically active chemical compounds (drugs) which might structurally resemble known active drugs (soft analogues) or could be entirely new types of structures, but which are all characterized by a predictable in vivo destruction (metabolism) to nontoxic moieties, after they achieve their therapeutic role. The metabolic disposition of the soft drugs takes place with a controllable rate in a predictable manner.

The present inventor has found five major classes of soft drugs. One of the most useful classes was termed the "inactive metabolite" approach which can be advantageously employed to design especially valuable "soft drugs." This approach starts with a known inactive metabolite of a drug or a drug class; followed by modifying the metabolite to resemble

-3-

structurally (isoteric and/or isoelectronic) the active drug (i.e., activation); and designing the metabolism of the activated species to lead to the starting inactive metabolite after achieving the
5 desired therapeutic role, without the formation of toxic intermediates (i.e., predictable metabolism). The "inactive metabolite" approach further allows controlling the rate of metabolism and pharmacokinetic properties by molecular manipulation in the activation
10 stage. Also, if no useful inactive metabolite is known, one can be designed by the introduction of transporting groups in noncritical structural parts.

Summary of the Invention

The present inventor has now applied his
15 inactive metabolite approach to the case of the natural and synthetic glucocorticosteroids and has designed the soft steroidal anti-inflammatory agents of the present invention, beginning with the known or analogously designed inactive natural metabolites of
20 the glucocorticosteroids. Thus, for example, in the case of hydrocortisone, one of its major, inactive metabolites, cortienic acid, i.e., 11β , 17α -dihydroxyandrost-5-en-3-one- 17β -carboxylic acid, has been used as a starting point and activated by the
25 introduction of suitable nontoxic 17α - and 17β -substituents, which activated derivatives will cleave in vivo, at the 17β -position, and possibly also the 17α -position, after accomplishment of their nontoxic role, to predetermined or designed inactive
30 metabolites, e.g., non-toxic moieties.

SUBSTITUTE SHEET

-4-

In accord with the foregoing, the present invention provides novel soft steroids having anti-inflammatory activity, said steroids having the structural formula

- 5 wherein R_1 is C_1 - C_{10} alkyl; C_2 - C_{10} (monohydroxy or polyhydroxy)alkyl; C_1 - C_{10} (monohalo or polyhalo)alkyl; or $-CH_2COOR_6$ wherein R_6 is unsubstituted or substituted C_1 - C_{10} alkyl, C_3 - C_8 cycloalkyl, C_3 - C_8 cycloalkenyl or C_2 - C_{10} alkenyl, the substituents
 10 being selected from the group consisting of halo, lower alkoxy, lower alkylthio, lower alkylsulfinyl, lower alkylsulfonyl, $-NH\overset{\overset{O}{\parallel}}{C}-(C_1-C_{10}\text{alkyl})$ and
 15 $-\overset{\overset{O}{\parallel}}{C}-(C_1-C_{10}\text{alkyl})$, or R_6 is unsubstituted or substituted phenyl or benzyl, the substituents being selected from the group consisting of lower alkyl, lower alkoxy, halo, carbamoyl, lower alkoxy carbonyl, lower alkanoyloxy, lower haloalkyl, mono(lower
 20 alkyl)amino, di(lower alkyl)amino, mono(lower alkyl)carbamoyl, di(lower alkyl)carbamoyl, lower

-5-

alkylthio, lower alkylsulfinyl and lower alkylsulfonyl; or R_1 is $-\text{CH}_2\text{CONR}_7\text{R}_8$ wherein R_7 and R_8 , which can be the same or different, are each hydrogen, lower alkyl, C_3 - C_8 cycloalkyl, phenyl or benzyl, or R_7 and R_8 are combined such that $-\text{NR}_7\text{R}_8$ represents the residue of a saturated monocyclic secondary amine; or R_1 is unsubstituted or substituted phenyl or benzyl, the substituents being selected from the group of phenyl and benzyl substituents defined hereinabove with respect to R_6 ; or R_1 is $-\text{CH}-\overset{\text{R}_9}{\text{Y}}-(\text{lower alkyl})$ wherein Y is $-\text{S}-$, $-\text{SO}-$, $-\text{SO}_2-$ or $-\text{O}-$ and R_9 is hydrogen, lower alkyl or phenyl, or R_9 and the lower alkyl group adjacent to Y are combined so that R_1 is a cyclic system of the type $-\text{CH}-\overset{\text{alkylene}}{\text{Y}}$ wherein Y is defined as above and the alkylene group contains 3 to 10 carbon atoms, of which at least 3 and no more than 6 are ring atoms; or R_1 is $-\text{CH}-\overset{\text{O}}{\underset{\text{R}_{10}}{\text{O}}}\text{CR}_6$ wherein R_6 is defined as hereinabove and R_{10} is hydrogen, lower alkyl, phenyl or haloalkyl;

R_2 is unsubstituted or substituted C_1 - C_{10} alkyl, C_3 - C_8 cycloalkyl, C_3 - C_8 cycloalkenyl or C_2 - C_{10} alkenyl, the substituents being selected from the group consisting of halo, lower alkoxy, lower alkylthio, lower alkylsulfinyl, lower alkylsulfonyl, $-\text{NH}-\overset{\text{O}}{\text{C}}-(\text{C}_1-\text{C}_{10}\text{alkyl})$ and $-\text{O}-\overset{\text{O}}{\text{C}}-(\text{C}_1-\text{C}_{10}\text{alkyl})$, or R_2 is unsubstituted or substituted phenyl or benzyl, the substituents being selected from the group consisting of lower alkyl, lower alkoxy, halo, carbamoyl, lower alkoxy carbonyl, lower alkanoyloxy, lower haloalkyl, mono(lower alkyl)amino, di(lower alkyl)amino,

SUBSTITUTE SHEET

-6-

mono(lower alkyl)carbamoyl, di(lower alkyl)carbamoyl, lower alkylthio, lower alkylsulfinyl and lower alkylsulfonyl;

5 R_3 is hydrogen, α -hydroxy, β -hydroxy, α -methyl, β -methyl, $=CH_2$, or α - or β -OR₂ wherein R₂ is identical to R₂ as defined hereinabove;

R_4 is hydrogen, fluoro or chloro;

R_5 is hydrogen, fluoro, chloro or methyl;

X is -O- or -S-;

10 Z is carbonyl or β -hydroxymethylene;

and the dotted line in ring A indicates that the 1,2-linkage is saturated or unsaturated.

A group of preferred compounds of formula (I) consists of those wherein:

15 R_1 is C₁-C₆ alkyl; C₁-C₆ (monohalo or polyhalo)alkyl; -CH₂COOR₆ wherein R₆ is C₁-C₆ alkyl; -CH₂-Y-(C₁-C₆ alkyl) wherein Y is -S-, -SO-, -SO₂- or -O-; or -CH₂-O^OCR₆' wherein R₆' is C₁-C₆ alkyl or
20 phenyl;

R_2 is C₁-C₆ alkyl, C₃-C₈ cycloalkyl, phenyl, benzyl or C₁-C₆ (monohalo or polyhalo)alkyl;

R_3 is hydrogen, α -hydroxy, α -methyl, β -methyl or α -OR₂ wherein R₂ is identical to R₂ as defined
25 hereinabove;

R_4 is hydrogen or fluoro;

R_5 is hydrogen or fluoro;

Z is β -hydroxymethylene;

30 and X and the dotted line in ring A are defined as hereinabove.

The invention further provides anti-inflammatory quaternary ammonium salts of selected compounds of formula (I), as discussed in further detail below. Novel intermediates to the compounds of

-7-

formula (I), e.g., the corresponding compounds wherein R_1 is hydrogen, are provided also.

5 The soft steroids of formula (I) and the quaternary ammonium salts thereof are extremely potent local antiinflammatory agents; however, by virtue of the fact that their facile in vivo destruction leads only to the inactive steroidal metabolite, the present compounds have far less systemic activity than the known glucocorticosteroids from whose inactive metabo-
10 lites they are derived. Indeed, many of the compounds of the present invention are entirely devoid of systemic activity. Such minimal -- or non-existent -- systemic activity means that the compounds of the present invention can be used in the local (e.g.,
15 topical) treatment of inflammatory conditions without the serious systemic side effects which attend the use of the known glucocorticosteroids.

Detailed Description of the Invention and the Preferred Embodiments:

20 With respect to the various groups encompassed by the generic terms used here and throughout this specification, the following definitions and explanations are applicable:

The alkyl, alkenyl and alkylene groupings can
25 be straight or branched-chain groups containing the aforementioned number of carbon atoms. Likewise, the alkyl portions of the alkoxy, alkylthio, alkylsulfinyl, alkylsulfonyl, alkoxycarbonyl, alkanoyloxy, haloalkyl, monoalkylamino, dialkylamino,
30 monoalkylcarbamoyl and dialkylcarbamoyl groupings each can be straight or branched-chain. The term "lower" used in conjunction with any of those groupings or in

-8-

conjunction with "alkyl" is intended to indicate that each alkyl portion therein can contain 1 to 8 carbon atoms.

Specific examples of alkyl radicals encompassed by formula (I), whether as specific values for R₁ or R₂, or as a portion of a R₁, R₂, or R₃ group, include methyl, ethyl, propyl, butyl, pentyl, hexyl, heptyl and octyl and their branched-chain isomers, as well as their straight and branched-chain higher homologues in the instances where "alkyl" can contain more than 8 carbon atoms. The alkenyl radicals can be exemplified by vinyl, propenyl and butenyl. Illustrative of the cycloalkyl and cycloalkenyl radicals are cyclopentyl, cyclohexyl, cyclopentenyl and cyclohexenyl. The alkylene moieties are typified by trimethylene, tetramethylene and the like.

The alkoxy, alkylthio, alkylsulfinyl, alkylsulfonyl, alkoxycarbonyl, alkanoyloxy, monoalkylamino, dialkylamino, monoalkylcarbamoyl and dialkylcarbamoyl groupings are of the type

-O-alkyl

-S-alkyl

-SO-alkyl

25 -SO₂-alkyl

-C(=O)-O-alkyl

SUBSTITUTE SHEET

-9-

5

and

10

respectively, wherein alkyl is as hereinbefore defined and exemplified.

With respect to the structural variables encompassed by the group of preferred compounds of formula (I) identified hereinabove, the term "C₁-C₆ alkyl" is used to refer to a straight or branched-chain alkyl group having 1 to 6 carbon atoms, such as methyl, ethyl, n-propyl, isopropyl, n-butyl, isobutyl, sec-butyl, tert-butyl, n-pentyl, n-hexyl and the like. In addition, the term "C₁-C₆ (monohalo or polyhalo)alkyl" is used to refer to a straight or branched-chain alkyl group having 1 to 6 carbon atoms substituted with from 1 to 3 halogen atoms, the term "halogen" as used herein including a chlorine atom, a bromine atom, an iodine atom or a fluorine atom. Specific examples of the contemplated monohaloalkyl and polyhaloalkyl groups include chloromethyl, dichloromethyl, trichloromethyl, bromomethyl, fluoromethyl, difluoromethyl, trifluoromethyl, 1-fluoroethyl, 1-chloroethyl, 2-chloroethyl, 2,2,2-trichloroethyl, 2,2,2-trifluoroethyl, 1,2-

30

SUBSTITUTE SHEET

-10-

dichloroethyl, 1-chloropropyl, 3-chloropropyl, 1-chlorobutyl, 1-chloropentyl, 1-chlorohexyl, 4-chlorobutyl and the like. Also, the term "C₃-C₈ cycloalkyl" is used to refer to a cycloalkyl radical
5 having 3 to 20 8 carbon atoms, such as cyclopropyl, cyclobutyl, cyclopentyl, cyclohexyl, cycloheptyl and cyclooctyl.

When R₁ in formula (I) is -CH₂CONR₇R₈ wherein -NR₇R₈ represents the residue of a saturated
10 monocyclic secondary amine, such monocycles preferably have 5 to 7 ring atoms optionally containing another hetero atom (-O-, -S- or -N-) in addition to the indicated nitrogen atom, and optionally bear one or more substituents such as phenyl, benzyl and methyl.
15 Illustrative of residues of saturated monocyclic secondary amines which are encompassed by the -NR₇R₈ term are morpholino, 1-pyrrolidinyl, 4-benzyl-1-piperazinyl, perhydro-1,2,4-oxathiazin-4-yl, 1- or 4-piperazinyl, 4-methyl-1-piperazinyl, piperidino,
20 hexamethyleneimino, 4-phenylpiperidino, 2-methyl-1-pyrazolidinyl, 1- or 2-pyrazolidinyl, 3-methyl-1-imidazolidinyl, 1- or 3-imidazolidinyl, 4-benzylpiperidino and 4-phenyl-1-piperazinyl.

Selected compounds of formula (I), i.e.,
25 compounds wherein R₁ is α -haloalkyl, readily form the corresponding soft quaternary ammonium salts which are likewise useful as soft anti-inflammatory agents. Thus, for example, the selected haloalkyl derivative of formula (I) can simply be reacted with a tertiary
30 amine (\geq N) or an unsaturated amine (\geq N) to afford the corresponding quaternary ammonium salt. The reactants are generally used in approximately equimolecular proportions and the reaction is conducted in the

SUBSTITUTE SHEET

-11-

presence of an inert solvent (e.g., ether, acetonitrile, CH_2Cl_2 , CH_3NO_2 , dimethylformamide, or the like), at a temperature of from room temperature to the reflux temperature of the solvent, for approximately 2 to 24 hours. Alternatively, the reaction can be conducted in the absence of a solvent by mixing the two reactants together and maintaining them at room temperature or between 20° to 70°C for 2 to 24 hours. In either case, the crystalline salt formed can be purified by crystallization from an ether-ethanol mixture, or the like.

The expression "unsaturated amine" used above denotes N-heterocyclic unsaturated systems having 3 to 10 members in the ring, and substituted derivatives thereof, where the unsaturation corresponds to the maximum number of non-cumulative double bonds, provided that the nitrogen atom contains no hydrogen atom as a substituent. The following examples will sufficiently illustrate the scope of the defined term:

20

1-Methylazirine

1-Methylpyrrole

1-Methylimidazole

Substituted derivatives of the unsaturated amines include groups as shown above containing one or more alkyl, -COO(alkyl) or -OCO(alkyl) substituents.

5 With respect to the expression "tertiary amine," this expression denotes amines wherein the nitrogen atom has no hydrogen atoms attached thereto and which are not among the N-heterocyclic unsaturated systems encompassed by the expression "unsaturated amine" as defined above. Typically, the term
10 "tertiary amine" includes trialkylamines, wherein the alkyl groups, which can be the same or different, each preferably contain 1 to 8 carbon atoms; trialkoxyamines wherein the alkoxy portions each contain 1 to 8 carbon atoms; tertiary saturated cyclic
15 amines such as quinuclidine or substituted quinuclidine (e.g., 3-acetoxyquinuclidine); and N-substituted derivatives of secondary saturated cyclic amines [e.g., an N-substituted derivative of morpholine, pyrrolidine, imidazolidine, pyrazolidine,
20 piperidine or piperazine, wherein the N-substituent can be a group such as (C₁-C₈)alkyl], optionally containing additional substituents such as methyl.

Preferred quaternary ammonium salts include those derived from 1,2-dimethylpyrrolidine,
25 3-acetoxyquinuclidine, 1-methylpyrrolidine, triethylamine and N-methylimidazole. Especially preferred are the quaternary ammonium salts derived from the reaction of the aforesaid amines with compounds of formula (I) wherein Z is
30 β -hydroxymethylene and R₁ is chloromethyl, most especially when R₂ is lower alkyl.

SUBSTITUTE SHEET

-15-

While all of the compounds encompassed by formula (I) above essentially satisfy the objectives of the present invention, nevertheless certain groups of compounds remain preferred. A "first" group of preferred compounds of formula (I) has been set forth in the Summary of the Invention hereinabove.

Another preferred group of compounds consists of the compounds of formula (I) wherein Z, X, R₁ and R₂ are defined as hereinabove, and the remainder of the structural variations are identical to those of hydrocortisone (i.e., R₃, R₄ and R₅ are each a hydrogen atom and the 1,2-linkage is saturated) or of prednisolone (i.e., R₃, R₄ and R₅ are each a hydrogen atom and the 1,2-linkage is unsaturated), most especially when R₁ and R₂ are as defined with respect to the "first" group of preferred compounds set forth hereinabove.

Another preferred group of compounds consists of the 6 α - and/or 9 α -fluoro and 16 α -or 16 β -methyl congeners of the compounds indicated in the preceding paragraph. Within this group, the compounds wherein Z, X, R₁ and R₂ are defined as hereinabove and the remaining structural variables are identical to those of fludrocortisone, betamethasone and dexamethasone are particularly preferred, most especially when R₁ and R₂ are as defined with respect to the "first" group of preferred compounds set forth hereinabove. Other compounds of particular interest within this group are those wherein Z, X, R₁ and R₂ are defined as hereinabove and the remaining structural variables are identical to those of triamcinolone, flumethasone, fluprednisolone or paramethasone, particularly when R₁ and R₂ are as defined with respect to the "first"

SUBSTITUTE SHEET

-16-

group of preferred compounds set forth hereinabove.
Yet other interesting compounds are those wherein Z,
X, R₁ and R₂ are defined as hereinabove, R₃ is $\alpha\text{-OR}_2$,
and the remaining structural variables are identical
5 to those of triamcinolone, particularly when R₁ and R₂
are as defined with respect to the "first" group of
preferred compounds set forth hereinabove.

In each of the groups of compounds indicated
in the three preceding paragraphs, the compounds
10 wherein X is oxygen are particularly preferred. Most
especially preferred are the compounds encompassed by
the groups indicated above wherein Z is
 β -hydroxymethylene, wherein X is oxygen, wherein R₂ is
C₁-C₆ alkyl (particularly methyl, ethyl, propyl or
15 isopropyl), and wherein R₁ is C₁-C₆ alkyl, C₁-C₆
(monohalo)alkyl (particularly chloromethyl) or -CH₂-Y-
(C₁-C₆ alkyl) wherein Y is defined as hereinabove
(particularly when the C₁-C₆ alkyl group is methyl).

The compounds of formula (I) can generally be
20 prepared by known methods, the method of choice being
dependent on the identity of the various substituents
in the desired final product.

One generally useful method for the
preparation of the compounds of formula (I) wherein Z
25 is β -hydroxymethylene and X is oxygen utilizes
steroidal starting materials of the formula

SUBSTITUTE SHEET

-17-

wherein R_4 , R_5 and the dotted line in ring A are defined as before and R_3' is hydrogen, α -methyl, β -methyl, α -OH, β -OH or $=CH_2$ (and which can be conveniently prepared by treatment of the corresponding 21-hydroxypregnenolones of the formula:

5

**SUBSTITUTE SHEET**

-18-

wherein R_3' , R_4 , R_5 and the dotted line in ring A are defined as above with $NaIO_4$ in a suitable organic solvent at room or elevated temperature.) According to this process of the invention, a starting material of formula (II) is reacted with R_2I and KOH , wherein R_2 is defined as above, under anhydrous conditions, in an appropriate inert organic solvent such as dimethylsulfoxide (DMSO), dichloromethane, chloroform or tetrahydrofuran, preferably in the presence of a suitable acid acceptor (e.g., triethylamine, pyridine, calcium carbonate or other appropriate base). Time and temperature are not critical factors; however the reaction is conveniently carried out at a temperature between about $0^\circ C$ and room temperature, for about 1 to 6 hours. The resultant novel 17α -alkoxy 17β -carboxylate has the formula:

SUBSTITUTE SHEET

-19-

wherein R_2 , R_4 , R_5 and the dotted line in the A ring are defined as above and R_3'' is H, α -CH₃, β -CH₃, α -OR₂, β -OR₂ or =CH₂. When R_3'' in the starting material of formula (II) is α -OH or β -OH, sufficient

5 R_2I is generally employed to ensure formation of the alkoxy grouping at the 16-position as well as at the 17-position [i.e., when R_3' in formula (II) is OH, R_3'' in the resultant intermediate of formula (III) is α - or β -OR₂].

10 Sometimes, when a compound of formula (I) wherein R_2 contains a sulfinyl or sulfonyl grouping is desired, such a grouping is not introduced via the R_2I reaction, but is prepared from the corresponding thio-containing R_2 derivative at a later stage in the

15 synthetic scheme, as will be discussed in more detail below.

After the above-described introduction of the 17 α - and 17 β -substituents, the resultant novel steroid of formula (III) is converted to its

20 corresponding 17 β -carboxylic acid of the formula:

SUBSTITUTE SHEET

-20-

wherein R_2 , R_4 , R_5 and the dotted line in the A ring are defined as above and R_3'' is H. The novel steroid (IV) is typically formed by reacting the steroid of (III) with KOH, under anhydrous conditions, in an appropriate inert organic solvent such as dimethylsulfoxide (DMSO), dichloromethane, chloroform or tetrahydrofuran.

After the above-described preparation of the novel steroid of formula (IV), the formula (IV) is converted to its corresponding metal salt of the formula:

**SUBSTITUTE SHEET**

-21-

wherein R_2 , R_3 ", R_4 , R_5 and the dotted line in the ring A are defined as above, and M is a suitable metal, e.g., alkali metal (such as sodium or potassium), alkaline earth metal/2, or thallium or NH_4^+ . The novel salt of formula (V) is typically formed by reacting the steroid of formula (IV) with a hydroxide (MOH) or alkoxide (MOR) in an appropriate organic solvent, such as ethyl ether or tetrahydrofuran, at a temperature of 0°C to room temperature, for 0.5 to 4 hours. Then, the salt of formula (V) is reacted with a compound of the formula R_1 -W wherein R_1 is defined as hereinabove and W is halogen, to afford the desired final product of formula (I). This step of the reaction sequence can be conveniently conducted at room temperature for about 1 to 24 hours, or at the boiling point of the solvent (i.e., acetonitrile, tetrahydrofuran, etc.) When it is desired to introduce a halosubstituted R_1 grouping into the steroid, e.g., when a compound of formula (I) wherein R_1 is chloromethyl is desired, it has been found that the reaction proceeds well using hexamethylphosphoramide as the solvent at lower temperatures (0-10°C) and employing a R_1 -W reactant wherein W is iodine (e.g., iodochloromethane). When a non-halogen containing R_1 grouping is desired (e.g., R_1 = alkyl or $-CH_2COOR_6$ where R_6 is alkyl, etc.), no such restrictions need be placed on the R_1 -W reactant or on the solvent; thus, W can be any halogen, preferably chloro or bromo, and the usual organic solvents such as dimethylformamide, dichloromethane, acetonitrile, tetrahydrofuran or chloroform can, if desired, be used instead of hexamethylphosphoramide. When a compound of formula (I) wherein R_1 contains a sulfinyl or sulfonyl grouping is desired, such a

SUBSTITUTE SHEET

-22-

grouping is not generally introduced via the R_1 -W reaction, but is subsequently prepared from the corresponding thio steroid, as described below.

The compounds of formula (I) wherein R_1 (or
5 R_2) is a sulfinyl- or sulfonyl-containing grouping can be prepared by oxidation of the corresponding thio steroids. Thus, for example, a compound of formula (I) wherein R_1 is $-\underset{\text{R}_9}{\text{CH}}-\text{S}-(\text{lower alkyl})$ [wherein R_9 is
10 H, lower alkyl, or combined with the lower alkyl group adjacent to S to form a cyclic system, as described hereinabove] can be reacted with 1 equivalent of m-chloroperoxy-benzoic acid at 0° - 25°C for 1 to 24 hours, in a suitable solvent such as
15 chloroform, to afford the corresponding compound of formula (I) wherein R_1 is $-\underset{\text{R}_9}{\text{CH}}-\text{SO}-(\text{lower alkyl})$, or with 2 equivalents of m-chloroperoxybenzoic acid to afford the corresponding compound of formula (I) wherein R_1 is $-\underset{\text{R}_9}{\text{CH}}-\text{SO}_2(\text{lower alkyl})$. This type of
20 reaction can also be utilized to prepare compounds of formula (I) wherein R_1 is $-\text{CH}_2\text{COOR}_6$ wherein R_6 is substituted alkyl, cycloalkyl, cycloalkenyl, alkenyl, phenyl, or benzyl, wherein the substituent is lower
25 alkylsulfinyl or lower alkylsulfonyl, from the corresponding lower alkylthio-substituted formula (I) steroids; to prepare compounds of formula (I) wherein R_1 is lower alkylsulfinyl- or alkylsulfonyl-
30 substituted phenyl or benzyl from the corresponding lower alkylthio-substituted formula (I) steroids; and to prepare compounds of formula (I) wherein R_2 is substituted alkyl, cycloalkyl, cycloalkenyl, alkenyl, phenyl or benzyl wherein the substituent is lower
35 alkylsulfinyl or lower alkylsulfonyl, from the

SUBSTITUTE SHEET

-23-

corresponding lower alkylthio-substituted formula (I) steroids.

When the compounds of formula (I) wherein R₃ is α - or β -hydroxy are desired, same can be prepared by partial acid hydrolysis of the corresponding compounds of formula (I) wherein R₃ is α - or β -OR₂, in a suitable solvent medium. Use of a mild reagent, e.g., oxalic acid in methanol, is desirable. Alternatively, hydrolysis of the 16-alkoxy to the 16-hydroxy compound could be carried out at an earlier stage in any synthetic scheme described herein after the introduction of the 16,17 α -alkoxy, 17 β -carboxylate groupings, e.g., selective hydrolysis of an intermediate of formula (III) having 16 and 17 α -alkoxy groupings to the corresponding 16-hydroxy 17 α -alkoxy, followed by a two-step conversion to the corresponding compound of formula (I) as described supra.

Another process for the preparation of the compounds formula (I) wherein Z is β -hydroxymethylene and X is oxygen utilizes the same 17 α -hydroxy-17 β -carboxylic acid starting materials of formula (II) as are employed in the synthetic scheme supra, but involves formation of the 17 β -COOR₁ grouping prior to introduction of the 17 α -OR₂ substituent. Essentially, the same non-steroidal reactants, reaction conditions, etc., as described above are used for the introduction of each group. Thus, the starting material of formula (II) is first reacted with KOH in ROH to form the corresponding novel steroid of the formula:

SUBSTITUTE SHEET

-24-

wherein R_1 , R_3' , R_4 , R_5 and the dotted line in ring A are defined as above, which is in turn reacted with R_2I wherein R_2 is defined above, to afford the corresponding 17 α -alkoxy-17 β -carboxylate of formula (I). Thus, again, when the starting material contains a 16-hydroxy group, the 16-alkoxy-17 β -carboxylate of formula (I) will be formed which can then be selectively hydrolyzed, if desired, to the corresponding 16-hydroxy-17 β -carboxylate of formula (I).

After the above-described introduction of the 17 β -carboxylate substituent, the resultant novel steroid of formula (VI) is converted to its corresponding 3-(1',3'-dioxacyclopent-2'-yl) of the formula:

SUBSTITUTE SHEET

-25-

wherein R_1 , R_3' , R_4 and R_5 and the dotted line are defined as above and R_3' is H. The novel steroid (VII) is typically formed by reacting the steroid of (VI) with ethylene glycol in a solvent such as

5 p-toluenesulfonic acid.

After the above-described introduction of the heterocyclic group at the 3-position, the resultant novel steroid of formula (VII) is converted to its corresponding 17α -alkoxy compound of the formula:

SUBSTITUTE SHEET

-26-

wherein R_1 , R_2 , R_4 , and R_5 and the dotted line are defined as above and R_3' is H. The novel steroid (VIII) is typically formed by reacting the steroid of (VII) with KOH, under anhydrous conditions, in an appropriate inert organic solvent such as dimethylsulfoxide, dichloromethane, chloroform or tetrahydrofuran.

After the above-described introduction of the 17α -alkoxy substituent, the resultant novel steroid of formula (VIII) is converted to the corresponding 3-oxo- 17β -carboxylic acid of formula (IV) as previously described:

SUBSTITUTE SHEET

-27-

wherein R_2 , R_3' , R_4 , R_5 and the dotted line are defined as above and R_3' is H. The novel steroid of formula (IV) is typically formed by reacting the steroid of formula (VIII) with KOH, under anhydrous conditions, in an appropriate inert organic solvent such as dimethylsulfoxide, dichloromethane, chloroform or tetrahydrofuran. The reaction conditions used to convert III to IV are substantially the same as those used to convert VIII to IV.

After the above-described conversion of the 17β -carboxylate to the 17β -carboxylic acid moiety and conversion of the heterocyclic substituent to the oxo substituent at the 3-position, the resultant novel steroid of formula (IV) is reacted with MOH or MOR to form the corresponding intermediate of the formula (V) as previously described:

SUBSTITUTE SHEET

-28-

(V)

wherein R₂, R₃, R₄, R₅ and M and the dotted line in ring A are defined as above, which is then reacted with R₁W wherein R₁ and W are defined as above, to afford the corresponding 17β-carboxylate of the formula:

5

SUBSTITUTE SHEET

-29-

wherein R_1 , R_2 , R_3' , R_4 , R_5 and the dotted line in ring A are as defined above. Thus, again, when the starting material contains a 16-hydroxy group, the 16-alkoxy-17 β -carboxylate of formula (I) will be formed which can then be selectively hydrolyzed, if desired, to the corresponding 16-hydroxy-17 β -carboxylate of formula (I). And, again, the compounds of formula (I) in which R_1 or R_2 is a sulfinyl- or sulfonyl-containing grouping can be conveniently prepared by oxidation of the corresponding thio-containing compounds of formula (I) as detailed hereinabove. Alternatively, the compounds of formula (I) wherein R_1 is a sulfinyl- or sulfonyl-containing group [e.g., when R_1 is $-\underset{\text{R}_9}{\text{CH}}-\text{SO}-$ (lower alkyl) or $-\underset{\text{R}_9}{\text{CH}}-\text{SO}_2-$ (lower alkyl)] can be prepared by oxidation, preferably with m-chloroperoxybenzoic acid, of the corresponding compounds of formula (I) in which R_1 is a thio-containing group.

SUBSTITUTE SHEET

-30-

Other procedures for the preparation of selected compounds of formula (I) will be apparent to those skilled in the art. By way of example, a compound of formula (I) wherein R_1 or R_2 is halo-substituted can be subjected to a halogen exchange reaction in order to replace the halogen with a different halogen according to the order of reactivity $Cl < Br < I$. For example, reacting a chloroalkyl 17 β -carboxylate of formula (I) with an alkali metal iodide, e.g., sodium iodide, will afford the corresponding iodoalkyl 17 β -carboxylate. Similarly, a bromide salt (e.g., lithium bromide) can be reacted with a chloroalkyl 17 β -carboxylate to give the corresponding bromoalkyl 17 β -carboxylate. A suitable solvent for either reaction may be selected from the group consisting of hexamethylphosphoramide, acetone, ethanol, methyl ethyl ketone, dimethylacetamide, dimethylformamide and acetonitrile.

In like manner, a halogen exchange reaction based on relative solubilities can be used to convert a chloroalkyl 17 β -carboxylate or an iodoalkyl 17 β -carboxylate of formula (I) to the corresponding fluoroalkyl derivative. Silver fluoride can be employed in this reaction, which is conducted in a suitable organic solvent (e.g., acetonitrile), and which is especially useful in the preparation of the compounds in which R_1 is fluoromethyl or fluoroethyl.

The 21-hydroxypregnenolones from which the steroidal starting materials of formula (II) are prepared can be obtained commercially or prepared by known methods. Likewise, the nonsteroidal starting

SUBSTITUTE SHEET

-31-

materials used in the various processes discussed above are commercially available or can be prepared by known chemical procedures.

5 In yet another aspect, the present invention provides novel compounds of the formula:

wherein R_1 , R_2 , R_3 , R_4 , R_5 , X and the dotted line in ring A are as defined with respect to formula (I) above. The 11-keto compounds of formula (IX) can be prepared by the procedures described hereinabove for the preparation of the corresponding 11 β -hydroxy compounds of formula (I). Thus, a starting material corresponding to formula (II) but having an 11-keto group is reacted with R_2I , to afford the corresponding novel intermediate corresponding to formula (III) but having an 11-keto group; that intermediate is then

10

15

SUBSTITUTE SHEET

-32-

converted to the corresponding novel intermediate corresponding to formula (IV); that intermediate is then converted to its metal salt, which corresponds to formula (V) except for the presence of an 11-keto instead of an 11 β -hydroxy group; and the metal salt is then reacted with R₁W to afford corresponding compound of formula (IX). All reaction conditions are as previously described with respect to the corresponding processes for preparing the corresponding compounds of formula (I). Also, the preparation of the compounds of formula (IX), wherein R₁ is a sulfinyl- or sulfonyl- containing grouping or wherein R₃ is hydroxy generally proceeds as a final step in the synthetic scheme in a manner analogous to that used for the corresponding compounds of formula (I). Further, all of the above-described alternative processes for the preparation of the compounds of formula (I) are equally applicable to the preparation of the compounds of formula (IX) by simply substituting the 11-oxo starting material for the corresponding 11 β -hydroxy steroids used therein, e.g., replacing the 11-hydroxy group in formulas (VI), (VII) and (VIII) with an 11-oxo group and otherwise proceeding as described hereinabove for the reactions (II) \rightarrow (VI) \rightarrow (VII) \rightarrow (VIII) \rightarrow (IV) \rightarrow (V) \rightarrow (I).

Also, the compounds of formula (IX) can be prepared by reacting the corresponding compounds of formula (I) with an oxidizing agent. The oxidation of a compound of formula (I) in order to convert it into the corresponding compound of formula (IX) is usually carried out by using an oxidizing agent in an appropriate solvent. The solvent may be any conventional solvent, for example, water, an organic

SUBSTITUTE SHEET

-33-

acid (e.g. formic acid, acetic acid, trifluoroacetic acid), an alcohol (e.g. methanol, ethanol), a halogenated hydrocarbon (e.g. chloroform, dichloromethane), or the like. The oxidizing agent may also
5 be any conventional agent which is effective for oxidizing a hydroxy group to a carbonyl group, for example, pyridinium chlorochromate, chromium trioxide in pyridine, hydrogen peroxide, dichromic acid, dichromates (e.g. sodium dichromate, potassium
10 dichromate), permanganic acid, permanganates (e.g. sodium permanganate, potassium permanganate), or the like. The oxidizing agent is usually used in an amount of 1 mole or more, preferably 1 to 3 moles, per mole of the compound of formula (I). The reaction is
15 usually carried out at a temperature of 0° to 40°C, preferably at about room temperature, for about 6 to 30 hours.

The novel compounds of formula (IX) are useful as soft steroidal anti-inflammatory agents and
20 also in vivo or in vitro precursors of the corresponding 11 β -hydroxy compounds. Thus, the compounds of formula (IX) can be reduced in vitro to afford the corresponding compounds of formula (I), using a reducing agent known to be capable of reducing
25 the 11-oxo group to an 11 β -hydroxy group without modifying the remainder of the steroidal starting material. Typically, microbiological reduction is advantageous for carrying out the desired conversion, although chemical reduction also is possible.
30 Further, the compounds of formula (IX) may be formulated into appropriate dosage forms (e.g., retention enemas) for the treatment of conditions such as ulcerative colitis. In such dosage forms, it is

SUBSTITUTE SHEET

-34-

thought that the compounds of formula (IX) are microbiologically reduced by bacteria in the body (e.g. in the colon) to the highly active 11 β -hydroxy steroids, which elicit the desired anti-inflammatory response.

The preferred compounds of formula (IX) are those which are precursors of the preferred compounds of formula (I) wherein Z is β -hydroxymethylene, namely corresponding 11-keto compounds of formula (IX). An especially preferred group of compounds of formula (IX) consists of those wherein X, R₁ and R₂ are defined as above with respect to formula (I) and the remaining structural variations are identical to those of cortisone (i.e. R₃, R₄ and R₅ are each a hydrogen atom and the 1,2-linkage is saturated), of prednisone (i.e. R₃, R₄ and R₅ are each hydrogen and the 1,2 - linkage is unsaturated), or of the 6 α - and/or 9 α -fluoro and the 16 α - or 16 β -methyl congeners thereof, particularly when R₁ and R₂ are as defined with respect to the "first" group of preferred compounds set forth hereinabove. Most especially preferred of these derivatives are those wherein X is oxygen, R₂ is C₁-C₆ alkyl and R₁ is C₁-C₆ alkyl, C₁-C₆ (monohalo)alkyl [particularly chloromethyl] or -CH₂-Y-(C₁-C₆alkyl) [particularly -CH₂-Y-CH₃].

Under oxidation conditions, it is important to protect the 11-hydroxy group when preparing the compounds of the present invention since it is known that the mixture of dimethylsulfoxide and acetic anhydride has oxidative properties with respect to primary and secondary alcohols. Therefore, it is possible to prepare a 17 β -methylthiomethyl ether derivative having the formula

SUBSTITUTE SHEET

-35-

wherein R_3 , R_4 , R_5 , Z and the dotted line in ring A are as previously defined, from the compound of formula (I) using triethylamine and chloromethylmethylsulfide ($\text{ClCH}_2\text{SCH}_3$). The

5 methylthiomethyl ester of formula (X) is then treated with trifluoroacetic anhydride and pyridine at about -15°C to give mainly the desired 11β -trifluoroacetate derivative having the formula

SUBSTITUTE SHEET

-36-

wherein R_3 , R_4 , R_5 and the dotted line in ring A are as previously defined. The 11β -trifluoroacetate of formula (XI) is then transformed to the 17α -methylthiomethyl ester of formula (XII) using dimethyl sulfoxide and acetic anhydride under the same conditions as previously described.

SUBSTITUTE SHEET

-37-

wherein R_3 , R_4 , R_5 and the dotted line in ring A are as previously defined.

5 The compound of formula (XII) is then reacted with triethylamine and methanol in a sodium bicarbonate and water solution to form a compound having the formula

wherein R_3 , R_4 , R_5 and the dotted line in ring A are as previously defined.

Dexamethasone-type compounds having the structure:

SUBSTITUTE SHEET

-38-

(XIV)

may be prepared in a manner well-known to those of average skill in the art. For instance, a suitable starting material may be

(XIII)

SUBSTITUTE SHEET

-39-

wherein R_3 is as previously defined. The compound of formula (XIII) is reacted with KOH in methanol and the potassium salt of tertiary butyl hydroxide in tetrahydrofuran. The novel steroid formed has the formula:

wherein R_3 is as previously defined. The resultant novel steroid of formula (XV) is then converted to its corresponding chloromethyl ester of the formula:

SUBSTITUTE SHEET

-40-

wherein R₃ is as previously defined. The novel steroid (XIV) is typically formed by reacting the steroid of (XV) with KOH and chloromethylmethyl chlorosulfate (ClCH₂SO₂Cl) under phase transfer conditions. The article "Chlorosulfates as Reagents in the Synthesis of Carboxylic Acid Esters Under Phase-Transfer Conditions" by Binderup E. and Hansen E.T., in Synthetic Communications, 14(9), 857-864 (1984) discloses the use of chloromethyl chlorosulfate in the synthesis of chloromethyl esters of sensitive carboxylic acids under phase transfer conditions, which synthesis is applicable hereto.

The results of various activity studies of representative species of the invention, discussed in detail below, clearly indicate the potent anti-inflammatory activity and the minimal systemic activity toxicity of the soft steroids of formula (I). In view of this desirable separation of local and systemic activities, the compounds of the invention can be used in the treatment of topical or other localized inflammatory conditions without causing the serious systemic side effects typically exhibited by the known natural and synthetic glucocorticosteroids such as cortisone, hydrocortisone, hydrocortisone, 17 α -butyrate, betamethasone 17-valerate, triamcinolone, betamethasone dipropionate and the like.

TOPICAL VASOCONSTRICTION TEST

A topical vasoconstriction test was conducted using the general method of McKenzie, A.W. and R.B. Stoughton, Arch. Dermatol, 86, (1962), 608-10. The topical vasoconstriction test was done in order to

SUBSTITUTE SHEET

-41-

evaluate the anti-inflammatory potency of the novel compounds of the present invention. A 0.03M solution of the test compound in acetone/isopropylmyristate 90:10 volume/volume was prepared. An aliquot of 0.05 milliliter was applied to a circular patch, one centimeter in diameter, which was in turn applied against the skin of the flexor surface of the forearm (previously cleansed with ethanol 95% and dried). This application was occluded with a water-impervious film. The patch was removed after about six hours and the blanching score was evaluated one hour later. Two control compounds were used at the same time and under the same conditions. The control compounds were hydrocortisone 17-valerate and cortienic acid 17-ethylcarbonate chloromethylester. The experiment was made in duplicate and the average estimation values for the blanching activity are reported in Table I. The left column of Table I indicates the 17 α -substituent of the structure:

**SUBSTITUTE SHEET**

-42-

TABLE I
BLANCHING STUDIES

<u>17α-substituent</u>	<u>Value</u>
-OCH ₃ *	--
-OCH ₂ H ₅ **	0.75
-OC ₃ H ₇ **	1 **
-OC ₄ H ₉	0.5
valerate	1.5
carbonate	1.75

* The 17-methoxy homologue was determined in a previous study to have low activity.

** Simple study - duplicate experiment not conducted.

The compounds of formula (I) can be combined with suitable non-toxic pharmaceutically acceptable carriers to provide pharmaceutical compositions for use in the treatment of topical or other localized inflammation. Obviously, in view of their lack of systemic activity, the compounds of the present invention are not intended for treatment of conditions where systemic adrenocortical therapy is indicated, e.g., adrenocortical insufficiency. As examples of inflammatory conditions which can be treated with pharmaceutical compositions containing at least one compound of the invention and one or more pharmaceutical carriers, the following can be mentioned: dermatological disorders such as atopic dermatitis, acne, psoriasis or contact dermatitis; allergic states such as bronchial asthma; ophthalmic and otic diseases involving acute and chronic allergic and inflammatory reactions; respiratory diseases; ulcerative colitis;

SUBSTITUTE SHEET

-43-

and anorectal inflammation, pruritus and pain associated with hemorrhoids, proctitis, cryptitis, fissures, postoperative pain and pruritus ani. Such compositions may also be applied locally as a prophylactic measure against the inflammation and tissue rejection which arise in connection with transplants.

Obviously, the choice of carrier(s) and dosage forms will vary with the particular condition for which the composition is to be administered.

Examples of various types of preparations for topical/local administration include ointments, lotions, creams, powders, drops, (e.g. eye or ear drops), sprays, (e.g. for the nose or throat), suppositories, retention enemas, chewable or suckable tablets or pellets (e.g. for the treatment of aphthous ulcers) and aerosols. Ointments and creams may, for example, be formulated with an aqueous or oily base with the addition of suitable thickening and/or gelling agents and/or glycols. Such base may thus, for example, include water and/or an oil such as liquid paraffin or a vegetable oil such as arachis oil or castor oil, or a glycolic solvent such as propylene glycol or 1,3-butanediol. Thickening agents which may be used according to the nature of the base include soft paraffin, aluminum stearate, cetostearyl alcohol, polyethylene glycols, woolfat, hydrogenated lanolin and beeswax and/or glyceryl monostearate and/or non-ionic emulsifying agents.

The solubility of the steroid in the ointment or cream may be enhanced by incorporation of an aromatic alcohol such as benzyl alcohol, phenylethyl alcohol or phenoxyethyl alcohol.

SUBSTITUTE SHEET

-44-

Lotions may be formulated with an aqueous or oily base and will in general also include one or more of the following, namely, emulsifying agents, dispersing agents, suspending agents, thickening agents, solvents, coloring agents and perfumes. Powders may be formed with the aid of any suitable base, e.g., talc, lactose or starch. Drops may be formulated with an aqueous base also comprising one or more dispersing agents, suspending agents or solubilizing agents, etc. Spray compositions may, for example, be formulated as aerosols with the use of a suitable propellant, e.g., dichlorodifluoromethane or trichlorofluoromethane.

The proportion of active ingredient in the compositions according to the invention will vary with the precise compound used, the type of formulation prepared and the particular condition for which the composition is to be administered. The formulation will generally contain from about 0.0001 to about 5.0% by weight of the compound of formula (I). Topical preparations will generally contain 0.0001 to 2.5%, preferably 0.01 to 0.5%, and will be administered once daily, or as needed. Also, generally speaking, the compounds of the invention can be incorporated into topical and other local compositions formulated substantially as are such presently available types of compositions containing known glucocorticosteroids, at approximately the same (or in the case of the most potent compounds of the invention, at proportionately lower) dosage levels as compared to known highly active agents such as methyl prednisolone acetate and beclomethasone dipropionate or at considerably lower

SUBSTITUTE SHEET

-45-

dosage levels as compared to less active known agents such as hydrocortisone.

Thus, for example, an inhalation formulation suitable for use in the treatment of asthma can be prepared as a metered-dose aerosol unit containing a representative species of the invention such as chloromethyl 17 α -methoxy-11 β -hydroxyandrost-4-en-3-one-17 β -carboxylate, according to procedures well-known to those skilled in the art of pharmaceutical formulations. Such an aerosol unit may contain a microcrystalline suspension of the aforementioned compound in suitable propellants (e.g., trichlorofluoromethane and dichlorodifluoromethane), with oleic acid or other suitable dispersing agent. Each unit typically contains 10 milligrams of the aforesaid active ingredient, approximately 50 micrograms of which are released at each actuation. When one of the more potent species of the invention, e.g. chloromethyl 17 α -methoxy-9 α -fluoro-11 β -hydroxy-16 α -methylandrosta-1,4-dien-3-one-17 β -carboxylate, is employed, each unit typically contains 1 milligram of the active ingredient and releases approximately 5 micrograms at each actuation.

Another example of a pharmaceutical composition according to the invention is a foam suitable for treatment of a wide variety of inflammatory anorectal disorders, to be applied anally or perianally, comprising 0.1% of a compound of formula (I) such as chloromethyl 17 α -ethoxy-11 β -hydroxyandrost-4-en-3-one 17 β -carboxylate, and 1% of a local anaesthetic such as pramoxine hydrochloride, in a mucoadhesive foam base of propylene glycol, ethoxylated stearyl alcohol, polyoxyethylene-10-

SUBSTITUTE SHEET

-46-

stearyl ether, cetyl alcohol, methyl paraben, propyl paraben, triethanolamine, and water, with inert propellents. When a more potent compound of the invention is employed, a less active ingredient
5 generally is used, e.g. 0.05% of chloromethyl 9 α -fluoro-11 β -hydroxy-17 α -methoxy-16 α -methylandrosta-1,4-dien-3-one-17 β -carboxylate.

Yet another pharmaceutical formulation according to the invention is a solution or suspension
10 suitable for use as a retention enema, a single dose of which typically contains 40 milligrams of a compound of the invention such as chlomethyl 17 α -ethoxy-11 β -hydroxyandrost-4-en-3-one-17 β -carboxylate (or 20 milligrams of a more potent compound of the
15 invention such as chloromethyl 9 α -fluoro-11 β -hydroxy-17 α -isopropoxy-16 β -methylandrosta-1,4-dien-3-one-17 β -carboxylate or chloromethyl 9 α -fluoro-11 β -hydroxy-16 α -methyl-17 α -propoxy androsta-1,4-dien-3-one-17 β -carboxylate) together with sodium chloride,
20 polysorbate 80 and from 1 to 6 ounces of water (the water being added shortly before use). The suspension can be administered as a retention enema or by continuous drip several times weekly in the treatment of ulcerative colitis.

25 Other pharmaceutical formulations according to the invention are illustrated in the examples which follow.

Without further elaboration, it is believed that one of ordinary skill in the art can, using the
30 preceding description, utilize the present invention to its fullest extent. Therefore, the following examples are to be construed as merely illustrative and not limitative of the remainder of the

SUBSTITUTE SHEET

-47-

specification and claims in any way whatsoever.

EXAMPLE 1

To a solution of hydrocortisone (15 grams, 0.04 mol) in 120 milliliters of tetrahydrofuran and 30 milliliters of methanol at room temperature is added a
5 warm (approximately 50°C) solution of sodium metaperiodate (25.7 grams, 0.12 mol) in 100 milliliters of water. The reaction mixture is stirred at room temperature for 2 hours, then is concentrated
10 under reduced pressure to remove the tetrahydrofuran and methanol. The solid is triturated with 50 milliliters of water, separated by filtration, washed with water and dried in vacuo at 50°C for 3 hours. The product, 11 β ,17 α -dihydroxyandrost-4-en-3-one 17 β -
15 carboxylic acid (i.e., cortienic acid), melts at 231-234°C, is obtained in approximately 96% yield (13.76 grams), and can be represented by the structural formula

SUBSTITUTE SHEET

-48-

EXAMPLE 2

To a solution of powdered potassium hydroxide (2.14 grams) in dimethylsulfoxide (10 milliliters) was added 11 β ,17 α -dihydroxyandrost-4-en-3-one-17 β -carboxylic acid (1.7 gram; 4.88 millimoles). The mixture was stirred for five minutes and immediately followed by addition of methyl iodide (1.22 milliliters; 19.5 millimoles). After stirring for one hour and fifteen minutes at 25°C, the mixture was diluted with 100 ml of ethylacetate. The mixture was then washed successively with 10 milliliters water, 10 milliliters Na₂S₂O₃ (5% weight/volume), 10 milliliters NaHCO₃ (5% weight/volume) and then three additional times with 10 milliliters water. The organic solution was then dried over MgSO₄ and evaporated under partial pressure. The white crystalline crude product weighed 1.73 gram (94% theoretical) and had a melting point of 195°C to 201°C. Crystallization from CH₂Cl₂/Pentane raised the melting point to 215°C to 217°C then 217°C to 218.5°C. Elemental analysis: Required C₇₀.18; H₈.57; Found C₇₀.16; H₈.62. I.R. (KBr) 3500, 1725, 1655, 1210, CM⁻², H nmr (CDCl₃): 0.93 (S, 3, 18CH₃); 1.43 (S, 3, 19CH₃); 3.10 (S, 3, 17OCH₃); 5:65 (S, 1, C=CH). The product, methyl 11 β -hydroxy-17 α -methoxyandrost-4-en-3-one-17 β -carboxylate, can be represented by the structural formula:

SUBSTITUTE SHEET

-49-

EXAMPLE 3

The methyl 11 β -hydroxy-17 α -methoxyandrost-4-en-3-one-17 β -carboxylate (3.76 grams; 10 millimoles) was stirred overnight (16 hours) at 50°C, under nitrogen in a mixture of powdered potassium hydroxide (4.50 grams) in 15 milliliters dimethylsulfoxide. The reaction mixture was then diluted with 200 milliliters water, acidified with dilute HCl, stirred 30 minutes and extracted with several portions of ethylacetate. The organic layer was then washed with 30 milliliters water, evaporated and taken up into 150 milliliters NaHCO₃ solution (5% weight/volume). The aqueous solution was then washed with 30 milliliters methylene chloride, acidified with diluted HCl, filtered, and the residue was dried in vacuo at 40°C overnight. The crude, yellow, pseudocrystalline product, 11 β -hydroxy-17 α -methoxyandrost-4-en-3-one-17 β -carboxylic acid, weighed 3.05 grams (84% theoretical) ¹H nmr (DMSO-d₆): 0.92 (s, 3, 18CH₃); 1.38 (s, 3, 19CH₃); 3.04 (s, 3, OCH₃); 5.50 (s, 1, C=CH); 8.28 (s, < 1, COOH). The product can be represented by the structural formula

**SUBSTITUTE SHEET**

-50-

EXAMPLE 4

A 1 normal solution of KOH (3.62 milligrams; 1 millimole) in methanol was added dropwise to the 11 β -hydroxy-17 α -methoxyandrost-4-en-3-one-17 β -carboxylic acid at 0°C in an ice bath. The solution was
5 evaporated under vacuo and dried thoroughly. The resulting potassium salt was mixed with 10 milliliters dimethylsulfoxide and 4 millimoles chloriodomethane. After stirring for seven hours at room temperature
10 (24°C), the mixture contained a precipitate of potassium iodide. The mixture was then diluted with 100 milliliters ethylacetate and washed successively with 18 milliliters water, 10 milliliters Na₂S₂O₃ (5% weight/volume), 10 milliliters NaHCO₃ and three times
15 with 10 milliliters water. The product was dried over MgSO₄ and evaporated under partial pressure. The dried product was purified by column chromatography from 12 grams of Silica gel (100-200 mesh type 60A special), eluted with EtOAc/CHCl₃ 20:80 and
20 crystallized from ethylacetate/ether to give a final product that melted at 195°C-196°C and ¹H nmr (CDCl₃): 0.95 (S,3,18CH₃); 1.43 (S,3,19CH₃) 3.12 (S,3,0CH₃); 5.60 (S,1,C=CH); 5.75 (S,2,COOCH₂Cl). IR (KBr): 3400, 1755, 1655, 1205, 1110 (ether) cm⁻¹. Elemental
25 analysis: Required: C64.30; H760; Cl8.63; Found: C64.16; H7.63; Cl8.63. The product, chloromethyl 11 β -hydroxy-17 α -methoxyandrost-4-en-3-one-17 β -carboxylate, can be represented by the structural formula:

SUBSTITUTE SHEET

-51-

EXAMPLE 5

11β, 17α-Dihydroxyandrosta-4-en-3-one-17β -
 carboxylic acid (3.484 grams; 10 millimoles) was
 dissolved into methylalcohol. A 10 milliliter
 5 solution of 1 normal KOH in methanol was added
 dropwise to the cold mixture. The solution was
 evaporated under vacuo and the residue was dried
 thoroughly and taken up into 20 milliliters
 dimethylsulfoxide and 2.5 milliliters methyl iodide (48
 10 millimoles). After stirring overnight at room
 temperature, the mixture was diluted with 150
 milliliters ethylacetate and washed successively with
 50 milliliters NaHCO₃ (3% weight/volume), 50
 milliliters Na₂S₂O₃ (5% weight/volume) and three
 15 additional times with 50 milliliters water. The
 mixture was dried over MgSO₄ and evaporated. The
 product crystallized from the ethylacetate, and 3
 crops gave 3.31 grams (92%) of white crystals melting
 at 206°C to 207°C (little at 207°C to 208°C). ¹H nmr
 20 (CDCl₃): 0.98 (s, 3, 18CH₃); 1.45 (s, 3, 19CH₃); 3.75

11 β ,17 α -dihydroxyandrost-4-en-3-one-17 β -carboxylate,
can be represented by the structural formula:

EXAMPLE 6

The methyl 11 β -17 α -dihydroxyandrost-4-en-3-one-17 β -carboxylate (10.332 grams; 22.5 millimoles) was taken into 178 milliliters of ethylene glycol, then 85 milligrams of p-toluenesulfonic acid (anhydrous, crystallized from benzene) was added. The solvent was slowly distilled off at 0.3-1 mm Hg for two hours. The distillation head was 60°C to 70°C and the mixture turned red after about 30 minutes when the compound started to precipitate. The suspension was neutralized with NaHCO₃ (the mixture turned colorless), then the suspension was poured into 200 milliliters of cold water and stirred for at least 30 minutes. The white precipitate was isolated by filtration, washed with water and dried in a freeze dryer. Thin layer chromatography showed a small amount of starting material and a few percent of a product that was identified as the Δ^9 .11 3,3' cyclic ketal. Triturating the product with a few milliliters of ether yielded white crystals of melting point 204°C

SUBSTITUTE SHEET

-53-

to 205°C that had satisfactory elemental analysis.

Required: C67.96; H8.43; Found: C67.71; H8.47. ^1H nmr (CDCl_3): 0.93 (S,3,18 CH_3); 1.27 (S,3,19 CH_3) 3.70 (S,3,COO CH_3); 3.90 (S,4,0 $\text{CH}_2\text{CH}_2\text{O}$); 5.12 (S,1,C=CH).

5 The product, methyl 11 β ,17 α -dihydroxyandrost-5-en-3-(1',3'-dioxacyclopent-2'-yl)-17 β -carboxylate, can be represented by the structural formula:

EXAMPLE 7

Powdered KOH (1.2 grams) was stirred 5 minutes into 15 milliliters dimethylsulfoxide, then 2.15 grams methyl 11 β ,17 α -dihydroxyandrost-5-en-3-(1',3'-dioxacyclopent-2'-yl)-17 β -carboxylate (5.3 millimoles) was added. This was immediately followed by the addition of 1.7 milliliters iodoethane (21.2 millimoles) and the mixture was stirred at 25°C for 23 hours. The reaction mixture was then diluted with 158 milliliters ethylacetate and washed successively with 50 milliliters $\text{Na}_2\text{S}_2\text{O}_3$ (5% weight/volume), and three times with 50 milliliters water. The mixture was then dried over MgSO_4 and evaporated to give 1.92 grams of a crude product (83% theoretical). Some product had been extracted in the aqueous phase and was identified

SUBSTITUTE SHEET

-54-

as cortienic acid-3,3'cyclic ketal. Purification from 45 grams of silica gel, eluting with benzene/EtOAc 80:20 yielded 1.1 gram of a white compound. IR (KBr): 3500, 1725, 1215, 1110, 1085 cm^{-1} . H nmr 0.90 (S,3,18CH₃); 1.10 (T,3,J=7Hz,OCH₂CH₃); 1.28 (S,3,19CH₃); 3.32 (M,2,OCH₂CH₃) 3.70 (S,3,COOCH₃); 3.95 (S,4,OCH₂CH₂O); 5.15(S,1,C=CH). The product, methyl 11 β -hydroxy-17 α -ethoxyandrost-5-en-3-(1',3'-dioxacyclopent-2'-yl)-17 β -carboxylate, can be represented by the structural formula:

Substitution of an equivalent quantity of iodopropane for iodoethane employed above and substantial repetition of the foregoing procedure afforded methyl 11 β -hydroxy-17 α -propoxy-androst-4-en-3-(1',3'-dioxacyclopent-2'-yl)-17 β -carboxylate, having an identical H nmr spectrum to that presented above without the triplet of 1.10 ppm.

Substitution of bromobutane for iodoethane at a ratio of 4 parts bromobutane per part methyl 11 β ,17 α -dihydroxyandrost-5-en-3-(1',3'-dioxacyclopent-2'-yl)-17 β -carboxylate and substantial repetition of

SUBSTITUTE SHEET

-55-

the foregoing procedure while allowing the reaction to proceed for three days afforded methyl 11 β -hydroxy-17 α -butoxyandrost-5-en-3-(1',3'-dioxacyclopent-2'-yl)-17 β -carboxylate. The crude product was a mixture of the methyl and butyl ester.

EXAMPLE 8

The methyl 11 β -hydroxy-17 α -ethoxyandrost-4-en-3(1',3'-dioxacyclopent-2'-yl)-17 β -carboxylate (1.1 grams, 2.5 millimoles), the first product described in Example 7, was stirred for 17 hours under nitrogen at 60°C in 5 milliliters dimethyl sulfoxide containing 0.5 grams of powdered KOH. The reaction was then taken up into 150 milliliters of water, acidified slowly with dilute HCl to pH 1.2, stirred for fifteen minutes and extracted four times with 80 milliliters EtOAc. The mixture was dried over MgSO₄ and evaporated. The crude product was dissolved in NaHCO₃ (3% weight/volume), washed with EtOAc and acidified. Drying gave 669 milligrams (64%) of acid (11). IR (KBr): 3500, 1715, 1670, 1085 cm⁻¹. H nmr (DMSO-d₆): 0.92 (S, 3, 18CH₃); 1.05 (T, 3, J=7Hz, OCH₂CH₃); 1.37 (S, 3, 19CH₃); 3.28 (M, 2, OCH₂CH₃); 5.55 (S, 1, C=CH). The product, 11 β -hydroxy-17 α -ethoxyandrost-4-en-3-one-17 β -carboxylic acid, can be represented by the structural formula:

SUBSTITUTE SHEET

-56-

Likewise, the second and third products described in Example 7 were subjected to substantially the same procedure described above. The products obtained were 11β-hydroxy-17α propoxyandrost-4-en-3-one-17β-carboxylic acid and 11β-hydroxy-17α-butoxyandrost-4-en-3-one-17β-carboxylic acid, respectively.

EXAMPLE 9

The potassium salt of the first product of Example 8, 11β-hydroxy-17α-ethoxyandrost-4-en-3-one-17β-carboxylic acid (1.58 millimole) was prepared in substantially the same manner as the potassium salt of Example 4. That is, the first product of Example 8 was stirred at room temperature for eight hours in 10 milliliters dimethylsulfoxide containing 1.25 milliliters chloriodomethane. The work-up described in Example 4 was followed and 0.594 gram of a crude product was obtained that was chromatographed on 15 grams silica gel, eluting with Hexane/EtOAc 80:20 then 70:30. Crystallization from CH₂Cl₂/Pentane gave white crystals melting at 203°C to 205°C. IR (KBr): 3400, 1750, 1650, 1205, 1110, 1060 cm⁻¹. H nmr (CDCl₃):

EXAMPLE 10

10 Methoxy 11 β , 17 α -dihydroxy-1, 4-diene-3-one-17 β -carboxylate (prednisolone) (30 grams; 0.08 moles) was placed in a solution of tetrahydrofuran and methanol. A warm water solution of 53 grams NaIO₄ was added dropwise. The reaction mixture was stirred for two hours at room temperature, then while the stirring was

15 continued, ice water was added to obtain crystalline materials. The crude crystals were washed with water then stirred and suspended in 800 milliliters of water for 30 minutes. The crystals were filtered, washed with water and dried. The colorless crystal product

20 weighed 27 grams (77 millimoles) which represents a 97% yield and had a melting point of 236°C to 238°C. The product, 11 β , 17 α -dihydroxy-1, 4-diene-3-one-17 β -carboxylic acid, can be represented by the formula:

**SUBSTITUTE SHEET**

-59-

EXAMPLE 11

To an ice cooled mixture of $11\beta,17\alpha$ -dihydroxy-1,4-diene-3-one- 17β -carboxylic acid (5.2 grams; 15 millimoles) as prepared in Example 10 and KOH (6.7 grams; 12 moles) in 30 milliliters of dimethylsulfoxide was added 3.7 milliliters methyl iodide (60 millimoles) under nitrogen. The mixture was stirred for 5 hours at room temperature. The reaction mixture was diluted with ethyl acetate. The organic phase was separated and washed successively with water, $\text{Na}_2\text{S}_2\text{O}_3$ solution, NaHCO_3 solution and finally with water. The mixture was dried over MgSO_4 and the solvent was evaporated. The resulting crystalline material was recrystallized from CH_2Cl_2 hexane to afford colorless prisms. The product weighed 2.7 grams (7.2 millimoles) which represents an 83% yield and had a melting point of 241°C to 246°C . $\text{C}_{22}\text{H}_{30}\text{O}_5$ 374.47: Theoretical: H 8.07; C 70.56; Found: H 8.13; C 70.54. The product, methyl 11β -hydroxy- 17α -methoxy-3-oxo-androsta-1,4-diene- 17β -carboxylate, can be represented by the formula:

SUBSTITUTE SHEET

-60-

In a similar manner, substitution of an equivalent quantity of propyl iodide (5.8 milliliters; 60 millimoles) for the methyl iodide employed in the first part of this example and substantial repetition of the procedure there detailed affords 1.9 gram propyl 11 β -hydroxy-17 α -propoxy-androsta-1,4-diene-3-one-17 β -carboxylate (4.4 moles; 29% yield). The final product, after crystallization from CH₂Cl₂ hexane, melts at 189°C to 190°C. C₂₆H₃₈O₅ 430.58: Theoretical: H 8.99; C 72.53; Found: H 9.04; C 72.26.

EXAMPLE 12

A mixture of 5.4 grams KOH (9 millimoles) and 4.5 grams methyl 11 β -hydroxy-17 α -methoxy-androsta-1,4-diene-3-one-17 β -carboxylate in 20 milliliters dimethylsulfoxide was stirred under nitrogen for five hours at 50°C. Water was added to the reaction mixture and the mixture was then acidified with 10% HCl. The reaction mixture was stirred for 30 minutes. The ethylacetate extract was washed with water and the solvent was evaporated. The residual solid was neutralized with sodium bicarbonate solution and the mixture was washed with dichloromethane. The aqueous phase was acidified with 10% HCl and the deposited crystalline material was filtered under suction. The dried crude crystals were washed with water and dried. The crude product was subjected to silica gel chromatograph (MeOH/CH₂Cl₂)=1/200-1/50. The product so obtained was recrystallized from methanol. The colorless prism product was 2.3 grams (6.4 millimoles) which represents yield of 53% and had a melting point of about 256°C to 257°C. C₂₁H₂₈O₅: 360.44: Theoretical: H 7.83; C 69.98; Found: H 8.02; C 70.01.

SUBSTITUTE SHEET

-61-

The product, 11 β -hydroxy-17 α -methoxy-androsta-1,4-diene-3-one-17 β -carboxylic acid, can be represented by the formula:

In a similar manner, the second product of
5 Example 11, propyl 11 β -hydroxy-17 α -propoxy-androsta-
1,4-diene-3-one-17 β -carboxylate (1.6 gram; 3.7
millimoles) and 1.8 gram KOH (32 millimoles) in 20
milliliters dimethylsulfoxide was heated at 50°C under
stirring in nitrogen for 20 hours. The crude acid was
10 worked up and chromatographically purified
(MeOH/CH₂Cl₂ = 1/500-1/30). Recrystallization from
ether afforded 0.62 grams 11 β -hydroxy-17 α -propoxy-
androsta-1,4-diene-3-one-17 β -carboxylic acid
representing a 43% yield and had a melting point of
15 223°C to 225°C. C₂₃H₂O₅: 388.50: Theoretical:

EXAMPLE 23

The methyl 11 β -hydroxy-17 α -methoxyandrost-4-en-3-one-17 β -carboxylate, (3.76 grams; 10 millimoles), was stirred overnight (16 hours) at 50°C, under

5 nitrogen, in a mixture compound of powdered potassium hydroxide (4.50 grams) and dimethylsulfoxide (15 milliliters). The reaction mixture is then diluted into water (200 milliliters), acidified with HCl, stirred 30 minutes and extracted with several portions

10 of ethyl acetate. The organic layer was then washed with water (30 milliliters), evaporated and taken up into 150 milliliters of NaHCO₃ solution (5% weight/volume). This aqueous solution was washed with 30 ml of methylene chloride, acidified with diluted

15 HCl, filtered, and the residue is dried in vacuo at 40°C overnight. The yellow, pseudocrystalline, crude product weighed 3.05 g (84% theor.). Elemental analysis: ¹H nmr (DMSO-d₆): 0.92 (s, 3, 18CH₃); 1.38 (s, 3, 19CH₃); 3.04 (s, 3, OCH₃); 5.50 (s, 1, C=CH);

20 8.28 (s, <1, COOH). Purification from Silica gel (CCl₄), eluting with EtOAc/Hexane 50:50 and crystallization from acetone gave a compound melting at 214°C to 216°C, with satisfactory elemental

-74-

analysis. The product, 11 β -hydroxy-17 α -methoxyandrost-4-en-3-one-17 β -carboxylic acid, can be represented by the structural formula:

EXAMPLE 24

5 The 11 β -hydroxy-17 α -methoxyandrost-4-en-3-one-17 β -carboxylic acid, (1 millimole) was suspended in methanol (5 milliliters) and a 1 normal solution of KOH in methanol (1 milliliter) was added dropwise at 0°C (ice bath). The solution was evaporated under
10 vacuo, dried thoroughly, and the resulting potassium salt was mixed with dimethylsulfoxide (10 milliliters) and chloriodomethane (4 millimoles). After stirring for 7 hours at room temperature (24°C), the mixture (containing a precipitate of potassium iodide) was
15 diluted with ethylacetate (100 milliliters) and washed successively with 10 milliliters water, 10 milliliters Na₂S₂O₃ (5% weight/volume), 10 milliliters NaHCO₃ and 3 times with water (10 milliliters) and dried over MgSO₄ and evaporated under partial pressure.
20 Purification by column chromatography from 12 grams of Silica gel (100-200 mesh type 60A) eluting with

-75-

EtOAc/CHCl₃ 20:80 and crystallization from ethylacetate/ether gave a product that melts at 195° to 196°C. ¹H nmr (CDCl₃): 0.95 (s, 3, 18CH₃); 1.43 (s, 3, 19CH₃); 3.12 (s, 3, OCH₃); 5.60 (s, 1, C=CH); 5.75 (s, 2, COOCH₂Cl). IR (KBr): 3400, 1755, 1655, 1205, 2110 (ether) cm⁻¹. Elemental analysis: Required: C64.30; H7.60; Cl18.63; Found: C64.16; H7.63; Cl18.63. The product, chloromethyl 11β-hydroxy-17α-methoxyandrost-4-en-3-one-17β-carboxylate, can be represented by the formula:

EXAMPLE 25

11β,17α-Dihydroxyandrost-4-en-3-one-17β-carboxylic acid (cortienic acid; 3.434 grams; 10 millimoles) was dissolved in methylalcohol, then a 1 normal solution of KOH in MeOH (10 milliliters) was added dropwise in the cold. The solution was evaporated under vacuo and the residue was dried thoroughly and taken up into dimethylsulfoxide (20 milliliters) and methyl iodide (2.5 milliliters; 40 millimoles). After stirring overnight at room temperature, the mixture was diluted with ethylacetate (15 milliliters) and washed successively with 50

SUBSTITUTE SHEET

-76-

milliliters NaHCO_3 (3% weight/volume), 50 milliliters
 $\text{Na}_2\text{S}_2\text{O}_3$ (5% weight/volume) and three times with 50
milliliters water, dried over MgSO_4 , and evaporated.
The product crystallized from ethylacetate, and 3
5 crops gave 3.31 g (92%) of white crystals melting at
206°C to 207°C (litt. 207°C to 208°C). ^1H nmr
(CDCl_3): 0.98 (s, 3, 18CH_3); 1.45 (s, 3, 19CH_3); 3.75
(s, 3, COOCH_3); 5.67 (s, 1, $\text{C}=\text{CH}$). The product,
10 methyl $11\beta,17\alpha$ -dihydroxyandrost-4-en-3-one-17 β -
carboxylate, can be represented by the structural
formula:

EXAMPLE 26

The methyl $11\beta,17\alpha$ -dihydroxyandrost-4-en-3-one-17 β -carboxylate, (10.32 grams; 22.5 millimoles),
15 was taken up into ethylene glycol (170 milliliters) and p-toluenesulfonic acid (anhydrous, crystallized from benzene; 85 milligrams) was added. The solvent was slowly distilled off at 0.3-1 mm Hg for 2 hours. The distillation lead was 60°C to 70°C and the mixture
20 turned red after about 30 minutes. The suspension was neutralized with NaHCO_3 (the mixture turned colorless), poured into cold water (200 milliliters)

SUBSTITUTE SHEET

-77-

and stirred for at least 30 minutes. The white precipitate was isolated by filtration, washed with water and dried in the freeze dryer. Thin layer chromatography showed a small amount of starting material and a few percent of a product identified as the $\Delta^{9,11}$ 3,3' cyclic ketal. Triturating the product with a few milliliters of ether yielded white crystals having a melting point of 204°C to 205°C with satisfactory elemental analysis. Theoretical: C₆₇.96; H₈.43; Found: C₆₇.71; H₈.47. ¹H nmr (CDCl₃): 0.93 (s, 3, 18CH₃); 1.27 (s, 3, 19CH₃); 3.70 (s, 3, COOCH₃); 3.90 (s, 4, OCH₂CH₂O); 5.12 (s, 3, 19CH₃); 3.70 (s, 3, COOCH₃); 3.90 (s, 4, OCH₂CH₂O); 5.12 (s, 1, C=CH). The product, methyl 3-(1',3'-dioxacyclopent-2'-yl)-11 β ,17 α -dihydroxyandrost-5-en-3-one-17 β -carboxylate, can be represented by the structural formula:

SUBSTITUTE SHEET

-78-

EXAMPLE 27

Powdered KOH (1.2 grams) was stirred for five minutes into dimethylsulfoxide (15 milliliters), then the methyl 3-(1',3'-dioxacyclopent-2'-yl)-11 β ,17 α -dihydroxyandrost-5-en-3-one-17 β -carboxylate (2.15 grams; 5.3 millimoles) was added, immediately followed by iodoethane (1.7 milliliters, 21.2 millimoles) and the mixture was stirred at 25°C for 23 hours. The reaction was then diluted with ethylacetate (150 milliliters) and washed successively with 50 milliliters Na₂S₂O₃ (5% weight/volume) and three times with 50 milliliters water, dried over MgSO₄ and evaporated to give 1.92 grams of crude product (83% theoretical). Some product was extracted with the aqueous phase and was identified as cortienic acid-3,3' cyclic ketal. Purification from 45 grams of silica gel and eluting with benzene/EtOAc 80:20 yielded 1.1 g of a white compound. IR (KBr): 3500, 1725, 1215, 1110, 1085 cm⁻¹. H nmr 0.90 (s, 3, 18CH₃); 1.10 (t, 3, J=7Hz, OCH₂CH₃); 1.28 (s, 3, 19CH₃); 3.32 (m, 2, OCH₂CH₃) 3.70 (s, 3, COOCH₃); 3.95 (s, 4, OCH₂CH₂O); 5.15 (s, 1, C=CH). The product, methyl 3-(1',3'-dioxacyclopent-2'-yl)-17 α -ethoxy-11 β -hydroxyandrost-5-en-3-one-17 β -carboxylate, can be represented by the structural formula:

**SUBSTITUTE SHEET**

-79-

EXAMPLE 28

The methyl 3-(1',3'-dioxacyclopent-2'-yl)-11 β ,17 α -dihydroxyandrost-5-en-3-one-17 β -carboxylate and iodopropane were reacted following the same
5 procedure in Example 27. The H nmr spectrum was identical (without the triplet at 1.10 ppm). The product, methyl 3-(1',3'-dioxacyclopent-2'-yl)-11 β -hydroxy-17 α -propoxyandrost-5-en-3-one-17 β -carboxylate, can be represented by the following
10 structural formula:

EXAMPLE 29

The methyl 3-(1'3'-dioxacyclopent-2'-yl)-11 β ,17 α -dihydroxyandrost-5-en-3-one-17 β -carboxylate and bromobutane were reacted following the same
15 procedure in Example 25 except that a ratio of 4:1 of bromobutane to the 17 α -hydroxy compound was used and the reaction was allowed to proceed for three days. The crude product was a mixture of the methyl and butyl ester. The butyl ester, methyl 3-(1',3'-
20 dioxacyclopent-2'-yl)-17 α -butoxy-11 β -hydroxyandrost-5-en-3-one-17 β -carboxylate, can be represented by the structural formula:

SUBSTITUTE SHEET

EXAMPLE 30

The chloromethyl 11 β -hydroxy-17 α -methylthiomethoxyandrost-4-en-3-one-17 β -carboxylate (1.1 grams; 2.5 millimoles) was stirred for 17 hours under nitrogen at 60°C in dimethylsulfoxide (5 milliliters) containing powdered KOH (0.5 gram). The reaction was then taken up into water (150 milliliters), acidified slowly with dilute HCl to pH 1-2, stirred for 15 minutes and extracted four times with EtOAc (80 milliliters), dried over MgSO₄ and evaporated. The crude product was dissolved into NaHCO₃ (13% weight/volume), washed with EtOAc and acidified. Drying gave 669 mg (64%) of product. IR (KBR): 3500, 1715, 1670, 1085 cm⁻¹. H nmr (DMSOd₆): 0.92 (s, 3, 18CH₃); 1.05 (t, 3, J=7Hz, OCH₂CH₃); 1.37 (s, 3, 19CH₃); 3.28 (m, 2, OCH₂CH₃); 5.55 (s, 1, C=CH). Purification from CCl₄ silica gel and crystallization from acetone gave a compound melting at 236°C to 240°C with satisfactory elemental analysis. The product, 17 α -ethoxy-11 β -hydroxyandrost-4-en-3-one-17 β -carboxylic acid, can be represented by the structural formula:

SUBSTITUTE SHEET

-81-

EXAMPLE 31

11β-Hydroxy-17α-propoxyandrost-4-en-3-one-17β-carboxylic acid and 17α-butoxy-11β-hydroxyandrost-4-en-3-one-17β-carboxylic acid were prepared following a similar procedure to Example 30 and gave satisfactory elemental analysis.

EXAMPLE 32

The 17α-ethoxy-11β-hydroxyandrost-4-en-3-one-17β-carboxylic acid (1.58 millimoles) was converted to the potassium salt following the same procedure as Example 24. The potassium salt was stirred at room temperature for eight hours in dimethylsulfoxide (10 milliliters) containing chloriodomethane (1.25 milliliters). After the work-up used in Example 24, 0.594 grams of crude product was obtained which was chromatographed on 15 grams silica gel, eluted with Hexane/EtOAc 80:20 then 70:30. Crystallization from CH₂Cl₂/Pentane gave white crystals melting at 203°C to 205°C. IR (KBr): 3400, 1750, 1650, 1205, 1110, 1060 cm⁻¹. H nmr (CDCl₃): 0.95 (s, 3, 18CH₃); 1.13 (t, 3, J=7Hz; OCH₂CH₃); 1.43

EXAMPLE 34

Chloromethyl 17 α -butoxy-11 β -hydroxyandrost-4-en-3-one-17 β -carboxylate was prepared following a similar procedure as Example 32 and had a melting point of 100°C to 151°C. IR (KBr) 3400, 1750, 1645, 1200, 1110 H nmr (CDCl₃): 0.98 (s, 3, 18CH₃); 1.45 (s, 3, 19CH₃); 3.28 (m, 2, OCH₂CH₂CH₃); 5.65 (s, 1, C-CH); 5.77 (s, 2, COOCH₂Cl).

EXAMPLE 35

The chloromethyl 11 β ,17 α -dihydroxyandrost-4-en-3-one-17 β -carboxylate was treated under the same conditions as Example 20. IR (KBr): 1755, 1705, 1660 cm⁻¹. H nmr (CDCl₃): 0.67 (s, 3, 18CH₃); 1.40 (s, 3, 19CH₃); 2.09 and 2.23 (2s, 12CH₂), 2.19 (s, 3, SCH₃); 4.45 (ABq, $\Delta\nu=0.06$ ppm, J_{AB}=12Hz, OCH₂S); 5.71 (s, 1, C=CH); 5.87 (s, 2, OCH₂Cl). The product, chloromethyl-17 α -methylthio-methyloxyandrost-4-en-3,11-dione-17 β -carboxylate, can be represented by the structural formula:

SUBSTITUTE SHEET

-84-

EXAMPLE 36

The chloromethyl 11 β ,17 α -dihydroxyandrost-4-en-3-one-17 β -carboxylate (80 milligrams), was taken up into dry CH₂Cl₂ (5 milliliters) and methylal (2 milliliters). A mixture of P₂O₅/silica gel 1:2 (100 milligrams) was added, while stirring. After stirring 7 hours at room temperature, the mixture was filtered, the silica gel was washed with CH₂Cl₂. The organic extracts were washed with concentrated NaHCO₃ solution and water. H nmr (CDCl₃): 0.83 (s, 3, 18CH₃); 1.41 (s, 3, 19CH₃); 3.40 (s, 3, OCH₃); 4.6 (2ABq, 11 β and 17 α -OCH₂O); 5.66 (s, 1, C=CH); 5.76 (ABq, $\Delta\nu$ =0.27 ppm; J_{AB}=6Hz; OCH₂Cl). The product, chloromethyl 11 β ,17 α -di(methoxymethoxy)androst-4-en-3-one-17 β -carboxylate, can be represented by the structural formula:

EXAMPLE 37

The chloromethyl 11 β ,17 α -dihydroxyandrost-4-en-3-one-17 β -carboxylate was treated at -78°C according to the procedure of Example 15 to obtain 2.44 grams of methyl-17 α -hydroxy-11 β -trifluoroacetoxysteroid-4-en-3-one-17 β -carboxylate and

SUBSTITUTE SHEET

-85-

350 milligrams of the disubstituted side product, methyl 11 β ,17 α -trifluoroacetoxysteroid-4-en-3-one-17 β -carboxylate. The product is easily separated by chromatography on 60 grams silica gel, eluting with EtOAc/Hexane 50:50. H nmr (CDCl₃): 0.82 (s, 3, 18CH₃); 1.27 (s, 3, 19CH₃); 3.70 (s, 3, COOCH₃); 5.69 (M, 2, C=CH and 11CH). IR (KBr): 1780; 1730; 1660 cm⁻¹. Elemental analysis: Required: C 60.25, H 6.38; Found: C 60.43, H 6.49. The product can be represented by the structural formula:

The side product can be easily hydrolyzed to the product, methyl 11 β ,17 α -dihydroxyandrost-4-en-3-one-17 β -carboxylate, by refluxing in MeOH/H₂O/NaHCO₃ following the procedure of Example 17.

15

EXAMPLE 38

The methyl 17 α -hydroxy-11 β -trifluoroacetoxysteroid-4-en-3-one-17 β -carboxylate (3.0 grams) was treated following the procedure of Example 16 to obtain 3.1 grams of product. H nmr (CDCl₃): 0.80 (s, 3, 18CH₃); 1.26 (s, 3, 19CH₃); 2.14

-88-

EXAMPLE 41

The methyl 17 α -methylthiomethoxy-11 β -trifluoroacetoxyandrost-4-en-3-one-17 β -carboxylate was treated following the procedure of Example 17. The product was methyl 11 β -hydroxy-17 α -methylthiomethoxyandrost-4-en-3-one-17 β -carboxylate.

EXAMPLE 42

The methyl 11 β -hydroxy-17 α -methylthiomethoxyandrost-4-en-3-one-17 β -carboxylate, (882 milligrams) was treated at room temperature with a 1 normal solution of potassium tertbutoxide in dimethylsulfoxide (5 milliliters). After 45 minutes under nitrogen, the mixture was poured into water (50 milliliters) and extracted with CH₂Cl₂. The aqueous layer was then combined with EtOAc (50 milliliters) and acidified slowly with 1 normal HCl while stirring. After extracting several times with EtOAc, the organic layers were dried over MgSO₄ and concentrated in vacuo. H nmr (DMSO-d₆) 0.94 (s, 3, 18 CH₃); 2.10 (s, 3, SCH₃); 4.26 (m, 1, 11CH); 4.37 (ABq, $\Delta\nu=0.13$ ppm, J_{AB}=11Hz, CH₂SCH₃); 5.56 (s, 1, C=CH). The product, 11 β -hydroxy-17 α -methylthiomethoxyandrost-4-en-3-one-17 β -carboxylic acid, can be represented by the structural formula:

SUBSTITUTE SHEET

-89-

EXAMPLE 43

The methyl 11 β -hydroxy-17 α -methoxymethoxyandrost-4-en-3-one-17 β -carboxylate was reacted following the procedure of Example 42. H nmr (DMSOd₆): 0.94 (s, 3, 18CH₃); 1.39 (s, 3, 19CH₃); 3.24 (s, 3, OCH₃); 4.56 (ABq, Δv =0.08 ppm, J_{AB}=7Hz, OCH₂O); 4.26 (m, 1, 11CH); 5.56 (s, 1, C=CH). m.p. 207-209°C. The product is 11 β -hydroxy-17 α -methoxy-methoxyandrost-4-en-3-one-17 β -carboxylic acid.

EXAMPLE 44

The 11 β -hydroxy-17 α -methoxymethoxyandrost-4-en-3-one-17 β -carboxylic acid was introduced into a mixture composed of water (20 milliliters), CH₂Cl₂ (10 milliliters) and NaHCO₃ (1.60 grams), then tetrabutylammonium hydrogen sulfate (0.105 grams) was added. After stirring for five minutes, a mixture of chloromethyl chlorosulfate (1.1 equivalent) in CH₂Cl₂ (10 milliliters) was slowly added over a period of 30 minutes. The mixture was then stirred an additional 30 minutes. The organic phase was separated, dried over Na₂SO₄ and concentrated in vacuo, to give the product in yield. H nmr (CDCl₃): 1.02 (s, 3, 18CH₃); 3.33 (s, 3, OCH₃); 4.43 (m, 1, 11CH); 4.62 (ABq, Δv =0.17 ppm, J_{AB}=7Hz, OCH₂O); 5.67 (s, 1, C=CH); 5.74 (ABq, Δv =0.14 ppm, J_{AB}=6Hz, OCH₂Cl). The product, chloromethyl 11 β -hydroxy-17 α -methoxymethoxyandrost-4-en-3-one-17 β -carboxylate, can be represented by the structural formula:

SUBSTITUTE SHEET

-90-

From the foregoing description, one of ordinary skill in the art can readily ascertain the essential characteristics of the present invention and, without departing from the spirit and scope thereof, can make various changes and/or modifications of the invention to adapt it to various usages and conditions. As such, these changes and/or modifications are properly, equitably and intended to be within the full range of equivalence of the following claims.

SUBSTITUTE SHEET

-91-

WHAT IS CLAIMED IS:

1. A compound selected from the group consisting of:

(a) a compound of the formula

5 wherein:

R_1 is C_1 - C_{10} alkyl; C_2 - C_{10} (monohydroxy or polyhydroxy) alkyl; C_1 - C_{10} (monohalo or polyhalo)alkyl; or $-CH_2COOR_6$ wherein R_6 is unsubstituted or substituted C_1 - C_{10} alkyl, C_3 - C_8 cycloalkyl, C_3 - C_8 cycloalkenyl or C_2 - C_{10} alkenyl, the substituents being selected from the group consisting of halo, lower alkoxy, lower alkylthio, lower alkylsulfinyl, lower alkylsulfonyl, $-NH\overset{\overset{O}{\parallel}}{C}-(C_1-C_{10} \text{ alkyl})$ and $-\overset{\overset{O}{\parallel}}{C}-(C_1-C_{10} \text{ alkyl})$, or R_6 is unsubstituted or substituted phenyl or benzyl, the substituents being selected from the group consisting of lower alkyl, lower alkoxy, halo, carbamoyl, lower

SUBSTITUTE SHEET

-92-

alkoxycarbonyl, lower alkanoyloxy, lower haloalkyl, mono(lower alkyl)amino, di(lower alkyl)amino, mono(lower alkyl)carbamoyl, di(lower alkyl)carbamoyl, lower alkylthio, lower alkylsulfinyl and lower alkylsulfonyl; or R_1 is $-\text{CH}_2\text{CONR}_7\text{R}_8$ wherein R_7 and R_8 , which can be the same or different, are each hydrogen, lower alkyl, $\text{C}_3\text{-C}_8$ cycloalkyl, phenyl or benzyl, or R_7 and R_8 are combined such that $-\text{NR}_7\text{R}_8$ represents the residue of a saturated monocyclic secondary amine; or R_1 is unsubstituted or substituted phenyl or benzyl, the substituents being selected from the group of phenyl and benzyl substituents defined hereinabove with respect to R_6 ; or R_1 is $-\text{CH}-\text{Y}-\overset{\text{R}_9}{\text{R}_9}$ (lower alkyl) wherein Y is $-\text{S}-$, $-\text{SO}-$, $-\text{SO}_2-$ or $-\text{O}-$ and R_9 is hydrogen, lower alkyl or phenyl, or R_9 and the lower alkyl group adjacent to Y are combined so that R_1 is a cyclic system of the type $-\text{CH}-\underset{\text{alkylene}}{\text{Y}}$ wherein Y is defined as above and the alkylene group contains 3 to 10 carbon atoms, of which at least 3 and no more than 6 are ring atoms; or R_1 is $-\text{CH}-\overset{\text{O}}{\text{O}}\text{CR}_6$ wherein R_6 is defined as hereinabove and R_{10} is hydrogen, lower alkyl, phenyl or halophenyl;

R_2 is unsubstituted or substituted $\text{C}_1\text{-C}_{10}$ alkyl, $\text{C}_3\text{-C}_8$ cycloalkyl, $\text{C}_3\text{-C}_8$ cycloalkenyl or $\text{C}_2\text{-C}_{10}$ alkenyl, the substituents being selected from the group consisting of halo, lower alkoxy, lower alkylthio, lower alkylsulfinyl, lower alkylsulfonyl, $-\text{NH}-\overset{\text{O}}{\text{C}}-(\text{C}_1\text{-C}_{10} \text{ alkyl})$ and $-\text{O}-\overset{\text{O}}{\text{C}}-(\text{C}_1\text{-C}_{10} \text{ alkyl})$, or R_2 is unsubstituted or substituted phenyl or benzyl, the substituents being selected from the group consisting of lower alkyl, lower alkoxy, halo, carbamoyl, lower alkoxycarbonyl, lower alkanoyloxy, lower haloalkyl,

SUBSTITUTE SHEET

-93-

mono(lower alkyl)amino, di(lower alkyl)amino,
mono(lower alkyl)carbamoyl, di(lower alkyl)carbamoyl,
lower alkylthio, lower alkylsulfinyl and lower
alkylsulfonyl;

5 R_3 is hydrogen, α -hydroxy, β -hydroxy, α -methyl,
 β -methyl, $=CH_2$, or α - or β -OR₂ wherein R₂ is identical
to R₂ as defined hereinabove;

R_4 is hydrogen, fluoro or chloro;

R_5 is hydrogen, fluoro, chloro or methyl;

10 X is -O- or -S-;

and the dotted line in ring A indicates that
the 1,2-linkage is saturated or unsaturated;

(b) a quaternary ammonium salt of a compound
of formula (I) wherein at least one of R₁ and R₂ is a
15 halo-substituted alkyl group;

(c) a compound of the formula

wherein R₂, R₃, R₄, R₅, and the dotted line in ring A
are as defined in (a) above, Z is carbonyl or β -
hydroxymethylene and R₃ is hydrogen, α -methyl, β -

SUBSTITUTE SHEET

-94-

methyl, $=CH_2$ or α - or β -OR₂ wherein R₂ is identical to R₂ above;

(d) a compound of the formula

5 wherein R₂, R₄, R₅, and the dotted line in ring A are as defined in (a) above, Z is carbonyl or β -hydroxymethylene and R₃ is hydrogen, α -methyl, β -methyl, $=CH_2$ or α - or β -OR₂ wherein R₂ is identical to R₂ above;

(e) a compound of the formula

SUBSTITUTE SHEET

-95-

wherein M is alkali metal, thallium, alkaline earth metal/2 or NH_4 and R_2 , R_3 , R_4 , R_5 , Z and the dotted line in ring A are as defined in (a) and (d) above;

f) a compound of the formula

- 5 where R_3 is hydrogen, α -methyl, β -methyl, α - OR_2 or β - OR_2 , and R_1 , R_4 and R_5 are as defined in (a) above;
- (g) A compound of the formula

SUBSTITUTE SHEET

-96-

wherein R_3 is hydrogen, α -methyl, β -methyl, α -OR₂ or β -OR₂, and R_1 , R_2 , R_4 and R_5 are as defined in (a) above;

5

(h) a compound of the formula

wherein R_1 , R_2 , R_3 , R_4 , R_5 , X and the dotted line in ring A are as defined in (g) above.

2. A compound selected from the group consisting of:

10

(a) a compound of the formula

SUBSTITUTE SHEET

-97-

wherein:

R_1 is C_1-C_6 alkyl; C_1-C_6 (monohalo or polyhalo)alkyl; $-CH_2COOR_6$ wherein R_6 is C_1-C_6 alkyl; $-CH_2-Y-(C_1-C_6$ alkyl) wherein Y is $-S-$, $-SO-$, $-SO_2-$ or $-O-$; or $-CH_2O\overset{O}{\parallel}CR_6'$ wherein R_6' is C_1-C_6 alkyl or phenyl;

R_2 is C_1-C_6 alkyl, C_3-C_8 cycloalkyl, phenyl, benzyl or C_1-C_6 (monohalo or polyhalo)alkyl;

R_3 is hydrogen, α -hydroxy, α -methyl, β -methyl or $\alpha-O\overset{O}{\parallel}R_2$ wherein R_2 is identical to R_2 as defined hereinabove;

R_4 is hydrogen or fluoro;

R_5 is hydrogen or fluoro;

X is $-O-$ or $-S-$;

and the dotted line in ring A indicates that the 1,2-linkage is saturated or unsaturated;

(b) a quaternary ammonium salt of a compound of formula (I) wherein at least one of R_1 and R_2 is a halo-substituted alkyl group;

(c) a compound of the formula

(III)

SUBSTITUTE SHEET

-98-

wherein R_2 , R_3 , R_4 , R_5 , and the dotted line is ring A are as defined in (a) above, Z is carbonyl or β -hydroxymethylene and R_3 is hydrogen, α -methyl, β -methyl, $=CH_2$ or α - or β -OR₂ wherein R_2 is identical to R_2 above;

(d) a compound of the formula

wherein R_2 , R_4 , R_5 , and the dotted line in ring A are as defined in (a) above, Z is carbonyl or β -hydroxymethylene and R_3 is hydrogen, α -methyl, β -methyl, $=CH_2$ or α - or β -OR₂ wherein R_2 is identical to R_2 above;

(e) a compound of the formula

SUBSTITUTE SHEET

-99-

wherein M is alkali metal, thallium, alkaline earth metal/2 or NH_4 and R_2 , R_3 , R_4 , R_5 , Z and the dotted line in ring A are as defined in (a) and (d) above;

(f) compound of the formula

- 5 wherein R_3 is hydrogen, α -methyl, β -methyl, α - OR_2 or β - OR_2 , and R_1 , R_4 and R_5 are as defined in (a) above;
 (g) a compound of the formula

SUBSTITUTE SHEET

-100-

wherein R_3 is hydrogen, α -methyl, β -methyl, α -OR₂ or β -OR₂, and R_1 , R_2 , R_4 and R_5 are as defined in (a) above;

(h) a compound of the formula

5 wherein R_1 , R_2 , R_3 , R_4 , R_5 , X and the dotted line in ring A are as defined in (g) above.

3. A compound of Claim 1 or 2, said compound having the structural formula (I).

10 4. A compound of Claim 1 or 2, said compound being a quaternary ammonium salt of a compound of formula (I) wherein at least one of R_1 and R_2 is a halo-substituted alkyl group.

5. A compound of Claim 1 or 2, said compound having the structural formula (III).

15 6. A compound of Claim 1 or 2, said compound having the structural formula (IV).

SUBSTITUTE SHEET

-101-

7. A compound of Claim 1 or 2, said compound having the structural formula (V).

8. A compound of Claim 1 or 2, said compound having the structural formula (VII).

5 9. A compound of Claim 1 or 2, said compound having the structural formula (VIII).

10. A compound of Claim 1 or 2, said compound having the structural formula (IX).

10 11. A compound of Claim 1, said compound having the structural formula (I) wherein R_3 is hydrogen, α -methyl, β -methyl, $=CH_2$, α -OR₂ or β -OR₂.

12. A compound of Claim 1 or 2, said compound having the structural formula (I) wherein R_1
15 is C₁-C₆ alkyl.

13. A compound of Claim 1 or 2, said compound having the structural formula (I) wherein R_1 is C₁-C₆ (monohalo or polyhalo)alkyl.

14. A compound of Claim 13 wherein C₁-C₆
20 (monohalo or polyhalo)alkyl is C₁-C₆ monohaloalkyl.

15. A compound of Claim 14, wherein C₁-C₆ monohaloalkyl is C₁-C₆ monochloroalkyl.

16. A compound of Claim 13 wherein C₁-C₆ monochloroalkyl is chloromethyl.

25 17. A compound of Claim 12 wherein R_2 is C₁-C₆ alkyl or C₁-C₆ monohaloalkyl.

18. A compound of Claim 13 wherein R_2 is C₁-C₆ alkyl.

30 19. A compound of Claim 14 wherein R_2 is C₁-C₆ alkyl.

SUBSTITUTE SHEET

-102-

20. A compound of Claim 15 wherein R₂ is C₁-C₆ alkyl.
21. A compound of Claim 16 wherein R₂ is C₁-C₆ alkyl.
- 5 22. A compound of Claim 12 wherein R₂ is C₃-C₈ cycloalkyl, phenyl, benzyl or C₁-C₆ (monohalo or polyhalo)alkyl.
- 10 23. A compound of Claim 13 wherein R₂ is C₃-C₈ cycloalkyl, phenyl, benzyl or C₁-C₆ (monohalo or polyhalo)alkyl.
24. A compound of Claim 14 wherein R₂ is C₃-C₈ cycloalkyl, phenyl, benzyl or C₁-C₆ (monohalo or polyhalo)alkyl.
- 15 25. A compound of Claim 15 wherein R₂ is C₃-C₈ cycloalkyl, phenyl, benzyl or C₁-C₆ (monohalo or polyhalo)alkyl.
- 20 26. A compound of Claim 16 wherein R₂ is C₃-C₈ cycloalkyl, phenyl, benzyl or C₁-C₆ (monohalo or polyhalo)alkyl.
27. A compound of Claim 1 or 2, said compound having the structural formula (I) wherein X is -O-.
28. A compound of Claim 13 wherein X is -O-.
29. A compound of Claim 14 wherein X is -O-.
- 25 30. A compound of Claim 15 wherein X is -O-.
31. A compound of Claim 27 wherein R₄ and R₅ are hydrogen.
32. A compound of Claim 28 wherein R₄ and R₅ are hydrogen.

SUBSTITUTE SHEET

-103-

33. A compound of Claim 29 wherein R_4 and R_5 are hydrogen.

34. A compound of Claim 30 wherein R_4 and R_5 are hydrogen.

5 35. A compound of Claim 27 wherein at least one of R_4 and R_5 is fluoro.

36. A compound of Claim 28 wherein at least one of R_4 and R_5 is fluoro.

10 37. A compound of Claim 29 wherein at least one of R_4 and R_5 is fluoro.

38. A compound of Claim 30 wherein at least one of R_4 and R_5 is fluoro.

39. A compound of Claim 27 wherein R_4 is fluoro and R_5 is hydrogen.

15 40. A compound of Claim 28 wherein R_4 is fluoro and R_5 is hydrogen.

41. A compound of Claim 29 wherein R_4 is fluoro and R_5 is hydrogen.

20 42. A compound of Claim 30 wherein R_4 is fluoro and R_5 is hydrogen.

43. A compound of Claim 36 wherein R_3 is α -methyl or β -methyl.

44. A compound of Claim 38 wherein R_3 is α -methyl or β -methyl.

25 45. A compound of Claim 40 wherein R_3 is α -methyl or β -methyl.

46. A compound of Claim 42 wherein R_3 is α -methyl or β -methyl.

SUBSTITUTE SHEET

-104-

47. A compound of Claim 1 or 2, said compound having the structural formula (I) wherein R_1 is $-\text{CH}_2\text{COOR}_6$, $-\text{CH}_2-\text{Y}-(\text{C}_1-\text{C}_6 \text{ alkyl})$ or $-\text{CH}_2-\overset{\text{O}}{\parallel}\text{CR}_6'$.

5 48. A compound of Claim 1, said compound having the structural formula (I) wherein R_1 is $-\text{CH}_2\text{CONR}_7\text{R}_8$.

49. A compound of Claim 48 wherein at least one of R_7 and R_8 is hydrogen or C_1-C_6 alkyl.

10 50. A compound of Claim 48 wherein R_7 and R_8 are combined so that $-\text{NR}_7\text{R}_8$ represents the residue of a saturated monocyclic secondary amine containing 5 to 7 carbon atoms.

15 51. A compound of Claim 50 wherein $-\text{NR}_7\text{R}_8$ represents morpholino, 1-pyrrolidinyl, 4-benzyl-1-piperazinyl, perhydro-1,2,4-oxathiazin-4-yl, 1- or 4-piperazinyl, 4-methyl-1-piperazinyl, piperidino, hexamethyleneimino, 4-phenylpiperidino, 2-methyl-1-pyrazolidinyl, 1- or 2-pyrazolidinyl, 3-methyl-20 1-imidazolidinyl, 1- or 3-imidazolidinyl, 4-benzylpiperidino or 4-phenyl-1-piperazinyl.

25 52. A compound of Claim 1, said compound having the structural formula (I) wherein R_1 is $-\overset{\text{R}_9}{\text{CH}}-\text{Y}-(\text{lower alkyl})$ wherein R_9 is hydrogen or methyl, or wherein R_9 and the lower alkyl group adjacent to Y are combined so that R_1 is $-\overset{\text{alkylene}}{\text{CH}}-\text{Y}$ wherein Y is $-\text{S}-$, $-\text{SO}-$, $-\text{SO}_2-$ or $-\text{O}-$ and the alkylene group 30 contains 3 to 10 carbon atoms, of which at least 3 and no more than 6 are ring atoms.

SUBSTITUTE SHEET

-105-

53. A compound of Claim 1 or 2, said compound having the structural formula (I) wherein the R_3 , R_4 and R_5 groupings and the 1,2-linkage are identical to those of a glucocorticosteroid selected from the group consisting of hydrocortisone and prednisolone.

54. A compound of Claim 1 or 2, said compound having the structural formula (I) wherein the R_3 , R_4 and R_5 groupings and the 1,2-linkage are identical to those of a glucocorticosteroid selected from the group consisting of fludrocortisone, betamethasone and dexamethasone.

55. A compound of Claim 1 or 2, said compound having the structural formula (I) wherein the R_3 , R_4 and R_5 groupings and the 1,2-linkage are identical to those of a glucocorticosteroid selected from the group consisting of flumethasone, fluprednisolone, methyl prednisolone and paramethasone.

56. A compound of Claim 1 or 2, said compound having the structural formula (I) wherein R_3 is α -OR₂, and wherein the R_4 and R_5 groupings and the 1,2-linkage are identical to those of triamcinolone.

57. A compound of Claim 1 or 2, said compound having the structural formula (III) wherein Z is β -hydroxymethylene and R_2 is C₁-C₆ alkyl.

58. A compound of Claim 1 or 2, said compound having the structural formula (IV) wherein Z is β -hydroxymethylene and R_2 is C₁-C₆ alkyl.

SUBSTITUTE SHEET

-106-

59. A compound of Claim 1 or 2, said compound having the structural formula (VII) wherein Z is β -hydroxymethylene and R₁ is C₁-C₆ alkyl or C₁-C₆ monohaloalkyl.

5 60. A compound of Claim 1 or 2, said compound having the structural formula (VIII) wherein Z is β -hydroxymethylene and R₂ is C₁-C₆ alkyl.

61. A compound of Claim 1 or 2, said compound having the structural formula (IX) wherein R₁ is C₁-C₆ (monohalo or polyhalo)alkyl.

62. A compound of Claim 61 wherein C₁-C₆ (monohalo or polyhalo)alkyl is C₁-C₆ monohaloalkyl.

63. A compound of Claim 62 wherein R₂ is C₁-C₆ alkyl.

15 64. A compound of Claim 1 or 2, said compound having the structural formula (IX) wherein R₁ is C₁-C₆ alkyl or C₁-C₆ monohaloalkyl, R₂ is C₁-C₆ alkyl or C₁-C₆ monohaloalkyl and X is -O-.

20 65. A compound of Claim 64 wherein the R₃, R₄ and R₅ groupings and the 1,2-linkage are identical to those of a glucocorticosteroid selected from the group consisting of cortisone, prednisone, chloroprednisone and meprednisone.

25 66. A pharmaceutical composition of matter comprising an anti-inflammatory effective amount of a compound of Claim 1 or 2 having the structural formula (I), in combination with a non-toxic pharmaceutically acceptable carrier therefor suitable for topical or other local application.

SUBSTITUTE SHEET

-107-

67. A method for alleviating inflammation in or on a warm-blooded animal exhibiting a topical inflammatory response, which comprises topically administering thereto an anti-inflammatory effective amount of a composition of Claim 66.

68. A method for alleviating inflammation in or on a warm-blooded animal exhibiting a localized inflammatory response, which comprises locally administering thereto an anti-inflammatory effective amount of a composition of Claim 66.

69. A method for alleviating inflammation in or on a warm-blooded animal exhibiting a topical inflammatory response, which comprises topically administering thereto an anti-inflammatory effective amount of a composition of Claim 1.

70. A method for alleviating inflammation in or on a warm-blooded animal exhibiting a localized inflammatory response, which comprises locally administering thereto an anti-inflammatory effective amount of a composition of Claim 1.
